

Logspace Computability	Logspace Transducers
The following resources are equally powerful:	Definition logspace transducer
1 logarithmic workspace	• a total deterministic logspace bounded TM with output
2 counting up to the length of the input $n$	is called logspace transducer
3 "finite fingers"	<ul> <li>total means: it halts on all inputs</li> </ul>
the following automata describe the same class of languages:	<ul> <li>with output means: ∃ write-only output tape</li> </ul>
1 logspace-bounded TMs	<ul> <li>hence, a logspace transducer has:</li> </ul>
2 k-counter automaton with linearly bounded counters	1 a two-way read-only input tape
• automata with two-way read-only input head	2 a two-way read/write logspace-bounded worktape initially blank
<ul> <li>k integer counters, tests for zero, add, subtract</li> <li>counters can hold values between 0 and n</li> </ul>	3 a write-only left-to-right output tape initially blank
$\mathbf{I}$ k-headed two-way finite automaton (k-FA for short)	$\frac{4}{2} \Sigma \text{ is the input alphabet}$
<ul> <li>k two-way read-only input heads</li> </ul>	5 I is the worktape alphabet
can only move on the input
