Model Checking Overview

RT (ICS @ UIBK)

AINA SIS

RT (ICS @ UIBK)

1/45

3/45

Limitations of LTL

• No LTL-operator that allows to look in the past (all LTL-operators only look in the future)

At some moment we see red and some moment before we see orange

 No possibility to fix and compare several moments in time Green holds until red appears, and at sometime in the future orange is

week 2

satisfied. Moreover, the red is later than the orange.

Statements can be encoded to LTL, but formalization is not obvious and error-prone

- orange U red or $(F \text{ orange}) \cup X \text{ red}$ or $F(\text{ orange} \land X F \text{ red})$
- (green U red) \land F orange \land ? or (green U red) \land F (orange \land X F red) or green U (green \land orange \land X (green U red))

Solution: Use first-order logic which speaks about points in time

- $\exists x : \operatorname{red}(x) \land \exists y : y < x \land \operatorname{orange}(y)$
- $\exists x : \operatorname{red}(x) \land \forall y : (y < x \Rightarrow \operatorname{green}(y)) \land \exists z : \operatorname{orange}(z) \land z < x$

First-order logic of 1 Successor (F1S)

F1S is like first-order (predicate) logic with the following differences

- The universe is fixed to ${\rm I\!N}$
- Two predefined binary predicates: = and < with the obvious semantics
- Two function symbols: ' is the successor function and 0 the constant for the number 0
- For each atomic proposition a (of the transition system) there is a unary predicate symbol a
- Semantic of these predicates are specified by input word:

For
$$w = \begin{bmatrix} 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & \dots \end{bmatrix}$$
 green

week 2

obtain green^w =
$$\{0, 2, 4, 6, \dots\}$$
 and $\operatorname{red}^w = \{2, 3, 5, 7, \dots\}$

RT (ICS @ UIBK)

First-order logic of 1 Successor

F1S Semantics

Use interpretations $\alpha : \mathcal{V} \to \mathbb{N}$ to map variables to numbers and sets $P_i \subseteq \mathbb{N}$ to interpret unary predicates a_i .

 α is extended to a mapping from terms to ${\rm I\!N}$ in the usual way:

- $\alpha(0) = 0$
- $\alpha(t') = 1 + \alpha(t)$

Then $\mathcal{P} = P_1, \dots, P_n$ and α satisfies φ , written $\mathcal{P} \models_{\alpha} \varphi$ iff

- $\varphi = t_1 = t_2$ and $\alpha(t_1) = \alpha(t_2)$
- $\varphi = t_1 < t_2$ and $\alpha(t_1) < \alpha(t_2)$
- $\varphi = a_i(t)$ and $\alpha(t) \in P_i$
- $\varphi = \neg \psi$ and $\mathcal{P} \not\models_{\alpha} \psi$
- $\varphi = \varphi_1 \land \varphi_2$ and $\mathcal{P} \models_{\alpha} \varphi_1$ and $\mathcal{P} \models_{\alpha} \varphi_2$

•
$$\varphi = \exists x : \psi$$
 and $\mathcal{P} \models_{\alpha[x:=n]} \psi$ for some $n \in \mathbb{N}$

•
$$\varphi = \forall x : \psi$$
 and $\mathcal{P} \models_{\alpha[x:=n]} \psi$ for all $n \in \mathbb{N}$

F1S Syntax

Let $\mathcal{V} = \{x, y, \dots\}$ be a set of variables (for time-points)

Let $\mathcal{S} = \{a_1, \ldots, a_n\}$ be a set of unary predicate symbols

The set of F1S-terms over $\ensuremath{\mathcal{V}}$ is the smallest set such that

- every variable of ${\mathcal V}$ is a term
- 0 is a term
- If t is a term then t' is also a term

The set of F1S-formulas over ${\mathcal V}$ and ${\mathcal S}$ is the smallest set such that

- $t_1 < t_2$ and $t_1 = t_2$ are formulas for every two terms t_1 and t_2
- $a_i(t)$ is a formula for every term t and $1\leqslant i\leqslant n$
- If φ and ψ are formulas and $x \in \mathcal{V}$ then $\varphi \land \psi, \neg \varphi, \exists x : \varphi$, and $\forall x : \varphi$ are formulas (connectives $\lor, \Rightarrow, \ldots$ are derived as usual)

Binding priority: $\{=,<\} \sqsupset \{\neg\} \sqsupset \{\land,\lor\} \sqsupset \{\Rightarrow,\Leftrightarrow\} \sqsupset \{\forall,\exists\}$

First-order logic of 1 Succe

RT (ICS @ UIBK)

RT (ICS @ UIBK)

8/45

F1S Semantics continued

 φ is closed F1S-formula iff φ does not contain free variables

For closed formula φ and infinite word $w \in (2^n)^\omega$ define

$$w \models \varphi \text{ iff } \mathcal{P}^w \models \varphi \qquad \text{where}$$

- $\mathcal{P}_w = P_1^w, \ldots, P_n^w$
- $P_i^w = \{m \in \mathbb{N} \mid w[m][i] = 1\}$
- w[m] is the letter (vector) A at the *m*-th position of w
- A[i] is the *i*-th element of vector A

Moreover, the language of φ is

$$\mathcal{L}(\varphi) = \{ w \mid w \models \varphi \}$$

First-order logic of 1 Successor

Relating LTL and F1S

Theorem

For every LTL-formula φ there is a closed F1S-formula $|t|_2f1s(\varphi)$ such that $\mathcal{L}(\varphi) = \mathcal{L}(|t|_2f1s(\varphi)).$

Proof.

Use mapping ltl_2fls : LTL-formulas × F1S-terms → closed F1S-formulas and define $ltl_2fls(\varphi) = ltl_2fls(\varphi, 0)$

- $Itl_2fls(a_i, t) = a_i(t)$
- $|\mathsf{tl}_2\mathsf{fls}(\neg \varphi, t) = \neg |\mathsf{tl}_2\mathsf{fls}(\varphi, t)$
- $\mathsf{ltl}_2\mathsf{fls}(\varphi \land \psi, t) = \mathsf{ltl}_2\mathsf{fls}(\varphi, t) \land \mathsf{ltl}_2\mathsf{fls}(\varphi, t)$
- $\operatorname{ltl_2fls}(X\varphi, t) = \operatorname{ltl_2fls}(\varphi, t')$
- $\mathsf{ltl}_2\mathsf{fls}(\varphi \cup \psi, t) = \exists x : t \leq x \land \mathsf{ltl}_2\mathsf{fls}(\psi, x) \land$ $\forall y : t \leq y \land y < x \Rightarrow \mathsf{ltl}_2\mathsf{fls}(\varphi, y)$

(x and y must be fresh in last step and $t \leq y$ abbrev. $t = y \lor t < y$)

week 2

HEDI

First-order logic of 1 Suco

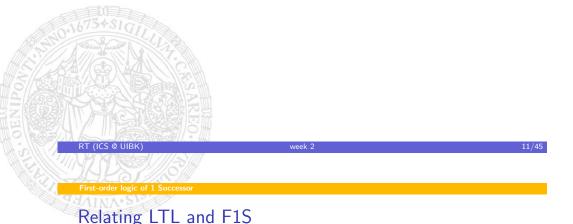

Example

RT (ICS @ UIBK)

Consider $\varphi = X(\neg a \cup X(b \wedge c))$. Then the translation yields

Proof of Correctness of Construction

Theorem

For every closed F1S-formula φ there is an LTL-formula f1s₂ltl(φ) such that $\mathcal{L}(\varphi) = \mathcal{L}(f1s_2 ltl(\varphi))$.

- $\Rightarrow\,$ LTL and F1S have same expressive power
- $\Rightarrow\,$ write readable, straight-forward specifications in F1S and perform LTL-model checking afterwards

Theorem (Considering sizes)

- If closed F1S-formula has size m then equivalent LTL-formula can be constructed which has size $O(2^{2\cdots^{2^m}})$ (height of tower is m)
- The bound is strict

RT (ICS @ UIBK)

- \Rightarrow Optimization for special cases strongly required
- \Rightarrow sometimes hand-written LTL-specifications may be better

week 2

week 2

12/45

Relating F1S and NBAs

Recall relation between LTL and NBAs

NBAs are strictly more powerful than LTL

 $(\mathcal{L} = \{(00)^n 1^\omega \mid n \in \mathbb{N}\}$ is NBA-definable, but not by LTL)

With previous results directly achieve

NBAs are strictly more powerful than F1S

Question: Is there a logic which has same expressiveness as NBAs?

Yes, extension of F1S to second-order (S1S)

week 2

$$\begin{split} \varphi &= \exists \mathsf{even} : \mathsf{even}(0) \land \forall x : \mathsf{even}(x) \Leftrightarrow \neg \mathsf{even}(x') \land \\ \exists y : \forall z : (z < y \Rightarrow \neg \mathsf{a}(z)) \land (y \leqslant z \Rightarrow \mathsf{a}(z)) \land \mathsf{even}(y) \end{split}$$

RT (ICS @ UIBK)

Second-order logic of 1 Successor

```
Expressiveness of S1S
```

All-Quantifier

- One can extend S1S by construct $\forall \mathbf{a}: \varphi$ with obvious semantics
- This does not increase power since

$$\forall \mathsf{a}: \varphi \quad \equiv \quad \neg \neg \forall \mathsf{a}: \varphi \quad \equiv \quad \neg \exists \mathsf{a}: \neg \varphi$$

Comparison to NBAs

Theorem (Equivalence of S1S and NBAs, Büchi)

- For every NBA A there is S1S-formula φ_A such that $\mathcal{L}(A) = \mathcal{L}(\varphi_A)$
- For every S1S-formula φ there is NBA A_{φ} such that $\mathcal{L}(\varphi) = \mathcal{L}(A_{\varphi})$

Syntax and Semantic of S1S

${\sf Syntax}$

S1S-formulas are extension of F1S-formulas where now

 $\mathcal{S} = \{\mathsf{a}_1, \mathsf{a}_2, \dots\}$ are second order variables ranging over subsets of $\mathbb{N}.$

S1S-formulas are built like F1S-formulas with the following extension:

• If φ is a formula then $\exists a_i : \varphi$ is also a formula

Write $\varphi(a_1, \ldots, a_n)$ to denote that a_1, \ldots, a_n are the free second-order variables of φ .

Semantic

Extend F1S-semantic as follows:

P₁,..., P_{n-1} ⊨_α ∃a_n : φ iff exists P_n ⊆ ℕ with P₁,..., P_n ⊨_α φ
If φ(a₁,..., a_n) has no free first-order variables then

 $\mathcal{L}(\varphi) = \{ w \in (2^n)^\omega \mid \mathcal{P}^w \models \varphi \}$

week 2

Second-order logic of 1 S

RT (ICS @ UIBK)

RT (ICS @ UIBK)

Consequences of Büchi's Theorem

Model Checking for S1S possible as for LTL

• Construct NBA $\mathcal{A}_{\neg arphi}$ and check $\mathcal{L}(\mathit{TS} \otimes \mathcal{A}_{\neg arphi}) = arnothing$

Satisfiability of S1S-formulas is decidable (Given φ , construct NBA \mathcal{A}_{φ} and check $\mathcal{L}(\mathcal{A}_{\varphi}) \neq \emptyset$)

• $\varphi_1 = \forall x : \exists y : x < y$

•
$$\varphi_2 = \forall x : \exists y : y < x$$

- $\varphi_3 = \forall a : a(0) \land (\forall x : a(x) \Rightarrow a(x')) \Rightarrow \forall x : a(x)$
- $\varphi_4 = \forall \mathsf{a} : \mathsf{a}(0) \land (\forall x : (\forall y : y < x \Rightarrow \mathsf{a}(y)) \Rightarrow \mathsf{a}(x)) \Rightarrow \forall x : \mathsf{a}(x)$

week 2

15/45

Short Distance to Undecidability

Theorem (Undecidability of first-order arithmetic, Gödel)

If one extends F1S by addition (+) and multiplication (\cdot) then satisfiability of formulas is undecidable.

Corollary

If one allows second-order quantification over relations (and not only over sets as in S1S), then satisfiability of formulas is undecidable.

Proving Büchi's Theorem, 1. Direction: NBA to S1S

Let
$$\mathcal{A} = (\mathcal{Q} = \{q_0, \dots, q_m\}, \Sigma = 2^n, q_0, \delta, F)$$

Main ideas:

RT (ICS @ UIBK)

Example

RT (ICS @ UIBK)

- φ_A guesses accepting run ρ for input variables a_1, \ldots, a_n
- To this end for each q_i a second-order variable b_i is used

 ρ should visit q_i at moment x iff $\mathbf{b}_i(x)$

week 2

week 2

20/4

- $\varphi_{\mathcal{A}}$ has to make sure that
 - the sets b_0, \ldots, b_m form a partition of ${\rm I\!N}$
 - infinitely often a final state is visited
 - the partition corresponds to a run w.r.t. δ

Second Direction: From S1S to NBA

Perform 3-step translation

- 1. From S1S to simplified logic S1S₀
- 2. From $S1S_0$ to NBA
 - (assuming that NBAs are closed under union and complement)

week 2

3. Show that NBAs are closed under union and complement

Second-order logic of 1 Successo

First Step: From S1S to S1S₀

Proof.

RT (ICS @ UIBK)

- 1. Eliminate 0: $\varphi[0] \rightsquigarrow \exists x : (\varphi[x] \land \neg \exists y : y' = x)$
- 2. Eliminate iteration of ': $\varphi[t''] \rightsquigarrow \exists x : (t' = x \land \varphi[x'])$
- 3. Eliminate $\langle : s \langle t \lor \forall b : (b(s') \land \forall x : b(x) \Rightarrow b(x')) \Rightarrow b(t)$ (*t* is in successor closure of s')
- 4. Eliminate ' in b: $b(t') \rightsquigarrow \exists x : t' = x \land b(x)$

Obtain S1S-formula with atomic formulas x' = y, x = y, and b(x) only From this obtain S1S₀-formula by replacing x by a_x :

week 2

- $\exists x : \varphi \rightsquigarrow \exists a_x : sing(a_x) \land \varphi$
- $\forall x : \varphi \rightsquigarrow \forall a_x : sing(a_x) \Rightarrow \varphi$
- $x' = y \rightsquigarrow \operatorname{succ}(a_x, a_y)$
- $x = y \rightsquigarrow \mathsf{a}_{\mathsf{x}} \subseteq \mathsf{a}_{\mathsf{y}} \land \mathsf{a}_{\mathsf{y}} \subseteq \mathsf{a}_{\mathsf{x}}$
- $b(x) \rightsquigarrow a_x \subseteq b$

Second-order logic of 1 Success

S1S₀

S1S₀: simplified version of S1S

- No first-order quantification, no 0, ', <, =
- sing predicate, $\mathcal{P} \models \text{sing}(a)$ iff $|P_a| = 1$
- succ predicate, *P* ⊨ succ(a, b) iff *P_a* = {*n*} and *P_b* = {*n*+1} for some *n* ∈ ℕ
- \subseteq predicate, $\mathcal{P} \models \mathsf{a} \subseteq \mathsf{b}$ iff $P_{\mathsf{a}} \subseteq P_{\mathsf{b}}$

Lemma

For each S1S-formula there is an equivalent S1S₀-formula.

Second-order logic of 1 Suco

Second Step: From S1S₀ to NBA

Lemma

RT (ICS @ UIBK)

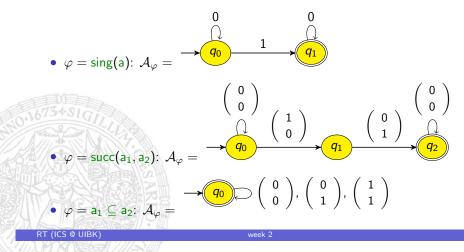

23/45

For each S1S₀-formula $\varphi(a_1, \ldots, a_n)$ there is an equivalent NBA \mathcal{A}_{φ} .

week 2

Proof

We use induction on φ . W.I.o.g. the only connectives are \lor, \exists, \neg .

Second-order logic of 1 Successor

Proof Continued

 φ = ∃a_{n+1} : ψ: By induction obtain A_ψ = (Q, Σ' = 2ⁿ⁺¹, q₀, δ', F). Obtain A_φ = (Q, Σ = 2ⁿ, q₀, δ, F) by dropping last component of input letters:

 $\delta(q, (b_1, \ldots, b_n)^T) = \delta'(q, (b_1, \ldots, b_n, 0)) \cup \delta'(q, (b_1, \ldots, b_n, 1))$

- $\varphi = \neg \psi$: By induction obtain \mathcal{A}_{ψ} . NBA complementation yields \mathcal{A}_{φ} .
- φ = ψ₁ ∨ ψ₂: By induction obtain A_{ψ1} and A_{ψ2}. First enlarge the input alphabets of both NBAs to have the same input letters. (Obtain B_{ψ1} and B_{ψ2} with same input alphabet). Then A_φ is the union NBA for B_{ψ1} and B_{ψ2}.

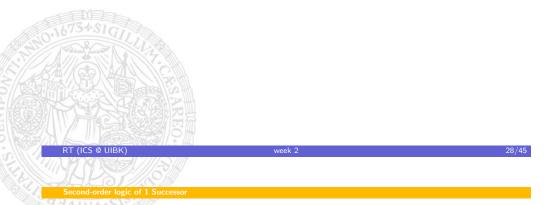

Enlargement: Let ψ_1 have free variables a_1, \ldots, a_n and ψ_2 has free variables a_1, \ldots, a_k then $\mathcal{A}_{\psi_2} = (\mathcal{Q}, 2^k, q_0, \delta', F)$. Define $\mathcal{B}_{\psi_2} = (\mathcal{Q}, 2^n, q_0, \delta, F)$ where $(c_1, \ldots, c_n)^T \in \delta(q, (b_1, \ldots, b_n)^T)$ iff $(c_1, \ldots, c_k)^T \in \delta'(q, (b_1, \ldots, b_k)^T)$. \mathcal{B}_{ψ_1} is defined in the same way.

RT (ICS @ UIBK)

Second-order logic of 1 Successor

Illustration of Enlargement

Illustration of \exists

Third Step: NBA operations

Union

RT (ICS @ UIBK

Let $\mathcal{A}_1 = (\mathcal{Q}_1, \Sigma, q_{0,1}, \delta_1, F_1)$ and $\mathcal{A}_2 = (\mathcal{Q}_2, \Sigma, q_{0,2}, \delta_2, F_2)$ be given where \mathcal{Q}_1 and \mathcal{Q}_2 are disjoint.

Idea for union NBA A: Copy both NBAs and add new starting state which chooses between A_1 and A_2 .

Formally: $\mathcal{A} = (\mathcal{Q}_1 \uplus \mathcal{Q}_2 \uplus \{q_0\}, \Sigma, \delta, q_0, F_1 \cup F_2)$ where δ is defined as follows:

week 2

- $\delta(q_0, A) = \delta_1(q_{0,1}, A) \cup \delta_2(q_{0,2}, A)$
- $\delta(q,A) = \delta_1(q,A)$ if $q \in \mathcal{Q}_1$
- $\delta(q, A) = \delta_2(q, A)$ if $q \in \mathcal{Q}_2$

Obviously: $\mathcal{L}(\mathcal{A}) = \mathcal{L}(\mathcal{A}_1) \cup \mathcal{L}(\mathcal{A}_2)$

Complementation of NFAs

Non-deterministic Finite Automata can be complemented in two steps:

- 1. Construct equivalent deterministic finite automaton (DFA)
- 2. Exchange final and non-final states of DFA

odd nr of *a*'s

even nr of *a*'s

Both steps do not work with NBAs

1. Not every NBA has a corresponding det. Büchi automaton (DBA)

week 2

2. Exchanging final and non-final states of DBA does not yield complement

RT (ICS @ UIBK)

Complementation of NBAs

Overview NBA Complementation

Complementing Büchi Automaton \mathcal{A} with $\mathcal{L} = \mathcal{L}(\mathcal{A})$

- 1. Find family of finitely many sets $U_1, \ldots, U_n \subseteq \Sigma^*$ such that
- 2. for all $i, j: U_i \cdot U_j^{\omega} \subseteq \mathcal{L}$ or $U_i \cdot U_j^{\omega} \cap \mathcal{L} = \emptyset$ $U_i \cdot U_i^{\omega}$ is completely in \mathcal{L} or not at all
- 3. every infinite word is contained in some $U_i \cdot U_i^{\omega}$.
- 4. Then assemble $2^{\omega} \setminus \mathcal{L} = \bigcup_{U_i \cdot U_j^{\omega} \cap \mathcal{L} = \varnothing} U_i \cdot U_j^{\omega}$.
- 5. Finally, show that everything can be encoded into one NBA.

Note that NBA $\mathcal{A} = (\mathcal{Q}, \Sigma, q_0, \delta, F)$ is fixed in remainder of this lecture.

Notations

- $a, b, \ldots \in \Sigma$ letters
- $u, v \in \Sigma^*$ finite words • $U, V \subset \Sigma^*$ sets of finite words
- $w \in \Sigma^{\omega}$ infinite word
- $W \subseteq \Sigma^{\omega}$ set of infinite words

states of NFA or NBA

infinite concatenation

concatenation

- $p,q\in\mathcal{Q}$
- $U \cdot W = \{uw \in \Sigma^{\omega} \mid u \in U, w \in W\}$
- $U^{\omega} = \{u_0 \ u_1 \ u_2 \dots \in \Sigma^{\omega} \mid \text{all } u_i \in U\}$
- δ extended to function $\hat{\delta} : \mathcal{Q} \times \Sigma^* \to 2^{\mathcal{Q}}$

$$\hat{\delta}(q,\varepsilon) = \{q\} \hat{\delta}(q,au) = \bigcup_{p \in \delta(q,a)} \hat{\delta}(p,u)$$

 $\hat{\delta}(q,u)$ are all states which are reachable when reading u starting in q

omplementation of NB/

RT (ICS @ UIBK)

32/45

34/45

Towards Step 1: Transition Profiles

Definition (Transition profile) Transition profiles are subsets of

$$\{p \twoheadrightarrow q \mid p, q \in \mathcal{Q}\} \cup \{p \twoheadrightarrow_F q \mid p, q \in \mathcal{Q}\}.$$

The transition profile of a finite word u is

 $\begin{array}{rcl} tp(u) &=& \{p \twoheadrightarrow q \mid q \in \hat{\delta}(p, u)\} \\ & \cup & \{p \twoheadrightarrow_F q \mid q \in \hat{\delta}(p, u), \text{ run from } p \text{ to } q \text{ contains final state}\} \end{array}$

10-1673+SIG

RT (ICS @ UIBK)

Definition (\mathcal{A} -equivalence) We define \mathcal{A} -equivalence as a relation $\sim_{\mathcal{A}} \subseteq \Sigma^* \times \Sigma^*$:

 $u \sim_{\mathcal{A}} v$ iff tp(u) = tp(v)

Step 1: A Family of Sets U_1, \ldots, U_n

Lemma

 $\sim_{\mathcal{A}}$ is an equivalence relation (reflexive, symmetric, transitive).

Lemma

 $\sim_{\mathcal{A}}$ has only finitely many equivalence classes.

Proof.

Obvious, since there are only finitely many transition profiles.

Let there be *n* equivalence classes of $\sim_{\mathcal{A}}$.

Define U_1, \ldots, U_n as the equivalence classes of $\sim_{\mathcal{A}}$.

week 2

week 2

RT (ICS @ UIBK)

36/45

Complementation of N

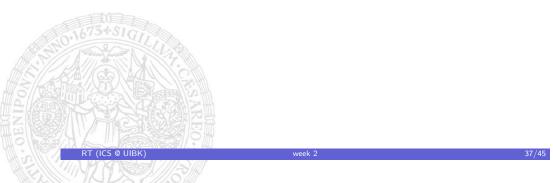

Step 2: $U_i \cdot U_i^{\omega}$ is Completely in \mathcal{L} or Not At All

Lemma

RT (ICS @ UIBK)

If $w \in U_i \cdot U_i^{\omega} \cap \mathcal{L}$ then $U_i \cdot U_i^{\omega} \subseteq \mathcal{L}$.

Example

Complementation of NB

Step 3: Every Word is Contained in Some $U_i \cdot U_j^{\omega}$ Recall the following result from graph theory:

Theorem (Infinite version of Ramsey's Theorem)

Let G be an undirected graph with infinitely many nodes N which is fully connected, and where every edge is colored with a color between 1 and n. Then there is an infinite subset M of nodes where all edges between these nodes have the same color.

Step 4: Assembling $2^{\omega} \setminus \mathcal{L}$ from U_1, \ldots, U_n

Obviously,

$$W_1:=igcup_{U_i \cdot U_j^\omega \cap \mathcal{L}=arnothing} U_i \cdot U_j^\omega \subseteq 2^\omega \setminus \mathcal{L}$$

With Step 2 we know: $U_i \cdot U_i^{\omega}$ is completely in \mathcal{L} or not at all. Hence,

$$W_2 := igcup_{U_i \cup U_j^\omega \cap \mathcal{L}
eq arnothing} U_i \cdot U_j^\omega \subseteq \mathcal{L}$$

Step 3 proves that $W_1 \cup W_2 = 2^{\omega}$. Hence

$$2^{\omega} \setminus \mathcal{L} = W_1 = \bigcup_{U_i \cdot U_j^{\omega} \cap \mathcal{L} = arnothing} U_i \cdot U_j^{\omega}$$

week 2

RT (ICS @ UIBK)

Complementation of NBA

Step 5.1: Construction of NFA for U_i Recall that $U_i = \{u \mid tp(u) = TP\}$ for some transition profile *TP*.

- $\begin{array}{rcl} tp(u) &=& \{p \twoheadrightarrow q \mid q \in \hat{\delta}(p, u)\} \\ & \cup & \{p \twoheadrightarrow_F q \mid q \in \hat{\delta}(p, u), \text{ run from } p \text{ to } q \text{ contains final state}\} \end{array}$
- Define $V_{pq} = \{u \mid q \in \hat{\delta}(p, u)\}$ and $V_{pq}^F = \{u \mid q \in \hat{\delta}(p, u), \text{ run from } p \text{ to } q \text{ contains final state}\}$
- Obviously, each V_{pq} is regular (accepted by NFA $(Q, \Sigma, p, \delta, \{q\})$)
- \Rightarrow each V_{pq}^F is regular, since $V_{pq}^F = \bigcup_{r \in F} V_{pr} \cdot V_{rq}$
- \Rightarrow U_i is regular since

RT (ICS @ UIBK)

$$U_{i} = \bigcap_{p \to q \in TP} V_{pq} \cap \bigcap_{p \to rq \in TP} V_{pq}^{F}$$

$$\cap \bigcap_{p \to q \notin TP} \Sigma^{*} \setminus V_{pq} \cap \bigcap_{p \to rq \notin TP} \Sigma^{*} \setminus V_{pq}^{F}$$

Here, we used the well-known result that regular languages are closed under concatenation, union, complement, and intersection

week 2

Step 5: $2^{\omega} \setminus \mathcal{L}$ can be encoded as NBA

$$2^{\omega} \setminus \mathcal{L} = igcup_{U_i \cup U_j^{\omega} \cap \mathcal{L} = arnothing} U_i \cdot U_j^{\omega}$$

For encoding of NBA need the following components:

- 1. Construct NFAs for each U_i
- 2. Construct NBA for infinite concatenation U_i^{ω} given NFA for U_i
- 3. Construct NBA for concatenation $U_i \cdot U_j^{\omega}$ given NFA for U_i and NBA for U_i^{ω}
- 4. Construct NBA for intersection of $U_i \cdot U_j^{\omega} \cap \mathcal{L}$ and check resulting NBA on emptyness

week 2

5. Construct final NBA as union $\bigcup_{i} U_i \cdot U_i^{\omega}$

Union and emptyness-check of NBAs have already been presented. Intersection of NBAs can also easily be done (IMC)

Complementation of NE

RT (ICS @ UIBK)

40/45

42/45

Step 5.2: Construction of NBA for U^{ω}

Let $\mathcal{B}' = (\mathcal{Q}', \Sigma, q'_0, \delta', F')$ be NFA with $\mathcal{L}(\mathcal{B}') = U$.

Main ideas:

- Add new state q₀["] which will be visited between u_i and u_{i+1} in infinite word u₀ u₁ u₂ ... ∈ U^ω where each u_i ∈ U
- One can start in q_0'' and read words as in q_0'
- Whenever final state is reached one can jump back to q_0''

In detail: Let $\mathcal{B} = (\mathcal{Q}' \uplus \{q_0''\}, \Sigma, q_0'', \delta'', \{q_0''\})$ where δ'' is defined as:

- $\delta''(q_0'', a) = \delta'(q_0', a) \cup \{q_0'' \mid \text{if } F' \cap \delta'(q_0', a) \neq \emptyset\}$
- $\delta''(q, a) = \delta'(q, a) \cup \{q_0'' \mid \text{if } F' \cap \delta'(q, a) \neq \emptyset\}$ if $q \in \mathcal{Q}'$

Lemma $\mathcal{L}(\mathcal{B}) = \mathcal{L}(\mathcal{B}')^{\omega} = U^{\omega}$

RT (ICS @ UIBK)

43/45

RT (ICS @ UIBK)

week 2

Proof of Lemma

Step 5.3: Construction of NBA for $U_i \cdot U_i^{\omega}$

Let NFA $\mathcal{A}_1 = (\mathcal{Q}_1, \Sigma, q_{0,1}, \delta_1, F_1)$ and NBA $\mathcal{A}_2 = (\mathcal{Q}_2, \Sigma, q_{0,2}, \delta_2, F_2)$ be given such that $\mathcal{L}(\mathcal{A}_1) = U_i$ and $\mathcal{L}(\mathcal{A}_2) = U_j^{\omega}$. Main ideas:

- Copy both automata
- One can switch from \mathcal{A}_1 to \mathcal{A}_2 for every final state of \mathcal{A}_1

In detail: Let $\mathcal{B} = (\mathcal{Q}_1 \uplus \mathcal{Q}_2, \Sigma, q_{0,1}, \delta', F_2)$ where δ' is defined as:

week 2

45/45

- If $q' \in \delta_1(q, a) \cup \delta_2(q, a)$ then $q' \in \delta'(q, a)$
- If $q\in \mathcal{F}_1$ and $q'\in \delta_2(q_{0,2},a)$ then $q'\in \delta'(q,a)$
- No other states are in $\delta'(q, a)$

Lemma

RT (ICS @ UIBK)

$$\mathcal{L}(\mathcal{B}) = \mathcal{L}(\mathcal{A}_1) \cdot \mathcal{L}(\mathcal{A}_2) = U_i \cdot U_i^{\omega}$$
