1

Summary of Last Week

Definition (Bit Vector Theory)

- ▶ variable \mathbf{x}_k is list of length k of propositional variables $x_{k-1} \dots x_2 x_1 x_0$
- ▶ constant n_k is bit list of length k
- ▶ formulas built according to grammar

$$\text{formula} := (\text{formula} \vee \text{formula}) \mid (\text{formula} \wedge \text{formula}) \mid (\neg \text{formula}) \mid \text{atom}$$
$$\text{atom} := \text{term} \text{ rel } \text{term} \mid \text{true} \mid \text{false}$$
$$\text{rel} := = \mid \neq \mid \geq_u \mid \geq_s \mid >_u \mid >_s$$
$$\text{term} := (\text{term} \text{ binop } \text{term}) \mid (\text{unop } \text{term}) \mid \text{var} \mid \text{constant} \mid \text{term}[i:j] \mid$$
$$(\text{formula} ? \text{term} : \text{term})$$
$$\text{binop} := + \mid - \mid \times \mid \div_u \mid \div_s \mid \%_u \mid \%_s \mid \ll \mid \gg_u \mid \gg_s \mid \& \mid \mid \mid \mid \wedge \mid ::$$
$$\text{unop} := \sim \mid -$$

- ▶ axioms are equality axioms plus rules for arithmetic/comparison/bitwise operations on bit vectors of length k
- ▶ solution assigns bit list of length k to variables \mathbf{x}_k

2

Remarks

- ▶ theory is decidable because carrier is finite
- ▶ common decision procedures use translation to SAT (bit blasting)
 - ▶ eager: no DPLL(T), bit-blast entire formula to SAT problem
 - ▶ lazy: second SAT solver as BV theory solver, bit-blast only BV atoms
- ▶ solvers heavily rely on preprocessing via rewriting

Definition (Bit Blasting: Formulas)

bit blasting transformation \mathbf{B} transforms BV formula into propositional formula:

$$\mathbf{B}(\varphi \vee \psi) = \mathbf{B}(\varphi) \vee \mathbf{B}(\psi)$$

$$\mathbf{B}(\varphi \wedge \psi) = \mathbf{B}(\varphi) \wedge \mathbf{B}(\psi)$$

$$\mathbf{B}(\neg\varphi) = \neg\mathbf{B}(\varphi)$$

$$\mathbf{B}(t_1 \text{ rel } t_2) = \mathbf{B}_r(u_1 \text{ rel } u_2) \wedge \varphi_1 \wedge \varphi_2 \quad \text{if } \mathbf{B}_t(t_1) = (u_1, \varphi_1) \text{ and } \mathbf{B}_t(t_2) = (u_2, \varphi_2)$$

bit blasting \mathbf{B}_t for term t
returns (result u , side condition φ)

\mathbf{B}_r transforms atom into propositional formula

3

Definition (Bit Blasting: Atoms)

for bit vectors \mathbf{x}_k and \mathbf{y}_k set

- ▶ equality

$$\mathbf{B}_r(\mathbf{x}_k = \mathbf{y}_k) = (x_k \leftrightarrow y_k) \wedge \dots \wedge (x_1 \leftrightarrow y_1) \wedge (x_0 \leftrightarrow y_0)$$

- ▶ inequality

$$\mathbf{B}_r(\mathbf{x}_k \neq \mathbf{y}_k) = (x_k \oplus y_k) \vee \dots \vee (x_1 \oplus y_1) \vee (x_0 \oplus y_0)$$

- ▶ unsigned greater-than or equal

$$\mathbf{B}_r(\mathbf{x}_1 \geq_u \mathbf{y}_1) = y_0 \rightarrow x_0$$

$$\mathbf{B}_r(\mathbf{x}_{k+1} \geq_u \mathbf{y}_{k+1}) = (x_k \wedge \neg y_k) \vee ((x_k \leftrightarrow y_k) \wedge \mathbf{B}(\mathbf{x}[k-1:0] \geq \mathbf{y}[k-1:0]))$$

- ▶ unsigned greater-than

$$\mathbf{B}(\mathbf{x}_k >_u \mathbf{y}_k) = \mathbf{B}(\mathbf{x}_k \geq \mathbf{y}_k) \wedge \mathbf{B}(\mathbf{x}_k \neq \mathbf{y}_k)$$

4

Definition (Bit Blasting: Bitwise Operations)

for bit vectors \mathbf{x}_k and \mathbf{y}_k use fresh variable \mathbf{z}_k and set

- ▶ bitwise and

$$\mathbf{B}_t(\mathbf{x}_k \& \mathbf{y}_k) = (\mathbf{z}_k, \varphi) \quad \varphi = \bigwedge_{i=0}^{k-1} z_i \leftrightarrow (x_i \wedge y_i)$$

- ▶ bitwise or

$$\mathbf{B}_t(\mathbf{x}_k | \mathbf{y}_k) = (\mathbf{z}_k, \varphi) \quad \varphi = \bigwedge_{i=0}^{k-1} z_i \leftrightarrow (x_i \vee y_i)$$

- ▶ bitwise exclusive or

$$\mathbf{B}_t(\mathbf{x}_k \hat{=} \mathbf{y}_k) = (\mathbf{z}_k, \varphi) \quad \varphi = \bigwedge_{i=0}^{k-1} z_i \leftrightarrow (x_i \oplus y_i)$$

- ▶ bitwise negation

$$\mathbf{B}_t(\neg \mathbf{x}_k) = (\mathbf{z}_k, \varphi) \quad \varphi = \bigwedge_{i=0}^{k-1} z_i \leftrightarrow \neg x_i$$

5

Definition (Bit Blasting: Addition and Subtraction)

- ▶ addition

$$\mathbf{B}_t(\mathbf{x}_k + \mathbf{y}_k) = (\mathbf{s}_k, \varphi)$$

where

$$\varphi = (c_0 \leftrightarrow x_0 \wedge y_0) \wedge (s_0 \leftrightarrow x_0 \oplus y_0) \wedge \bigwedge_{i=1}^{k-1} (c_i \leftrightarrow \min2(x_i, y_i, c_{i-1})) \wedge (s_i \leftrightarrow x_i \oplus y_i \oplus c_{i-1})$$

ripple-carry adder:
 \mathbf{c}_k are carry bits

for fresh variables \mathbf{s}_k and \mathbf{c}_k and $\min2(a, b, d) = (a \wedge b) \vee (a \wedge d) \vee (b \wedge d)$

- ▶ unary minus

$$\mathbf{B}_t(-\mathbf{x}_k) = \mathbf{B}_t(\sim \mathbf{x}_k + \mathbf{1}_k)$$

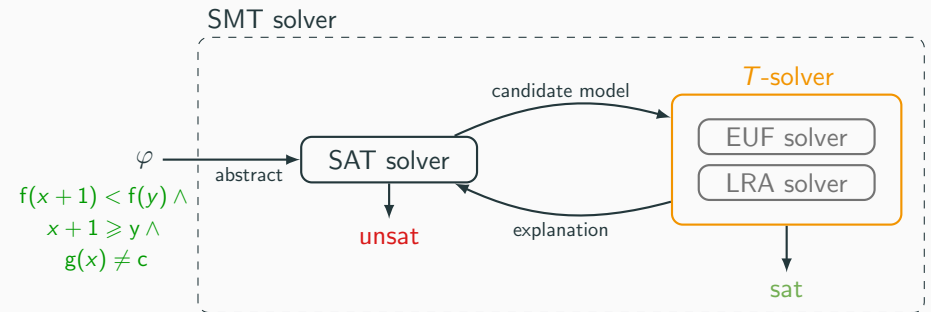

- ▶ subtraction

$$\mathbf{B}_t(\mathbf{x}_k + \mathbf{y}_k) = \mathbf{B}_t(\mathbf{x}_k + (-\mathbf{y}_k))$$

6

Nelson-Oppen Combination Method

How to Be Lazy

Theory T

- ▶ equality logic
- ▶ equality + uninterpreted functions (EUF)
- ▶ linear arithmetic (LRA and LIA)
- ▶ bitvectors (BV)

T -solving method

- equality graphs ✓
- congruence closure ✓
- DPLL(T) Simplex (+ cuts) ✓
- bit-blasting ✓

Theory combinations

Nelson-Oppen method

Definitions

- ▶ (first-order) **theory** consists of
 - ▶ signature Σ : set of function and predicate symbols
 - ▶ axioms T : set of sentences in first-order logic in which only function and predicate symbols of Σ appear
- ▶ theory is **stably infinite** if every satisfiable quantifier-free formula has model with infinite carrier set

Definition

theory combination $T_1 \oplus T_2$ of two theories

- ▶ T_1 over signature Σ_1
- ▶ T_2 over signature Σ_2

has signature $\Sigma_1 \cup \Sigma_2$ and axioms $T_1 \cup T_2$

Outline

- Summary of Last Week
- Nelson-Oppen Combination Method
 - Nondeterministic Version
 - Deterministic Version

Example

combination of linear arithmetic and uninterpreted functions:

$$x \geq y \wedge y - z \geq x \wedge f(f(y) - f(x)) \neq f(z) \wedge z \geq 0$$

Assumptions

two stably infinite theories

- ▶ T_1 over signature Σ_1
- ▶ T_2 over signature Σ_2

such that

- ▶ $\Sigma_1 \cap \Sigma_2 = \{=\}$
- ▶ T_1 -satisfiability of quantifier-free Σ_1 -formulas is decidable
- ▶ T_2 -satisfiability of quantifier-free Σ_2 -formulas is decidable

10

Nelson-Open Method: Nondeterministic Version

Input quantifier-free conjunction φ in theory combination $T_1 \oplus T_2$

Output satisfiable or unsatisfiable

1 purification

$$\varphi \approx \varphi_1 \wedge \varphi_2 \quad \text{for } \Sigma_1\text{-formula } \varphi_1 \text{ and } \Sigma_2\text{-formula } \varphi_2$$

2 guess and check

- ▶ V is set of shared variables in φ_1 and φ_2
- ▶ guess equivalence relation E on V
- ▶ **arrangement** $\alpha(V, E)$ is formula

$$\bigwedge_{x E y} x = y \quad \wedge \quad \bigwedge_{\neg(x E y)} x \neq y$$

- ▶ if $\varphi_1 \wedge \alpha(V, E)$ is T_1 -satisfiable and $\varphi_2 \wedge \alpha(V, E)$ is T_2 -satisfiable then return satisfiable else return unsatisfiable

11

Example

formula φ in combination of LIA and EUF:

$$\underbrace{1 \leq x \wedge x \leq 2 \wedge y = 1 \wedge z = 2}_{\varphi_1} \wedge \underbrace{f(x) \neq f(y) \wedge f(x) \neq f(z)}_{\varphi_2}$$

- ▶ $V = \{x, y, z\}$
- ▶ 5 different equivalence relations E :
 - 1 $\{\{x, y, z\}\}$ $\varphi_1 \wedge \alpha(V, E)$ is unsatisfiable
 - 2 $\{\{x, y\}, \{z\}\}$ $\varphi_2 \wedge \alpha(V, E)$ is unsatisfiable
 - 3 $\{\{x, z\}, \{y\}\}$ $\varphi_2 \wedge \alpha(V, E)$ is unsatisfiable
 - 4 $\{\{x\}, \{y, z\}\}$ $\varphi_1 \wedge \alpha(V, E)$ is unsatisfiable
 - 5 $\{\{x\}, \{y\}, \{z\}\}$ $\varphi_1 \wedge \alpha(V, E)$ is unsatisfiable
- ▶ φ is unsatisfiable

12

Outline

- Summary of Last Week
- Nelson-Open Combination Method
 - Nondeterministic Version
 - Deterministic Version

13

Application: Checking Program Equivalence

Relevance of Program Equivalence

correctness of compiler optimizations, regression testing, software verification

Example (Are the following two programs equivalent?)

```
int one(int x){
  unsigned z = x & (-1);
  unsigned y = z * 2;
  return foo(z) + y;
}
int two(int x){
  return foo(x) + (x << 1);
}
```

uninterpreted functions

bit vectors

Assert non-equivalence by SMT encoding:

$$\mathbf{one}_{32} = \mathbf{foo}(\mathbf{z}_{32}) + \mathbf{y}_{32} \wedge \mathbf{z}_{32} = \mathbf{x}_{32} \& (-\mathbf{1})_{32} \wedge \mathbf{y}_{32} = \mathbf{z}_{32} \times \mathbf{2}_{32} \wedge$$

$$\mathbf{two}_{32} = \mathbf{foo}(\mathbf{x}_{32}) + (\mathbf{x}_{32} \ll \mathbf{1}_{32}) \wedge$$

$$\mathbf{one}_{32} \neq \mathbf{two}_{32}$$

Remarks

- ▶ useful to combine BV and EUF theories
- ▶ checking equivalence of programs with loops is more challenging
