# Overview

## Week 8 - Efficiency

- Summary of Week 7

- Fibonacci Numbers

- Tupling

- Tail Recursion

# Overview

## Week 8 - Efficiency

Summary of Week 7

Fibonacci Numbers

Tupling

Tail Recursion

# Mathematical Induction

## Induction Principle

$$\underbrace{(P(m))}_{\text{base case}} \wedge \underbrace{\forall k \geq m. (P(k) \rightarrow P(k+1))}_{\text{step case}} \rightarrow \forall n \geq m. P(n)$$

## Example

- ▶ first domino will fall
- ▶ if a domino falls also its right neighbor falls

...

# Induction on Lists

## Induction Principle

$$\underbrace{(P([]))}_{\text{base case}} \wedge \underbrace{\forall x : \alpha. \forall xs : \alpha \text{ list. } (P(xs) \rightarrow P(x :: xs))}_{\text{step case}} \rightarrow \forall ls : \alpha \text{ list. } P(ls)$$

## Lemma

@ is associative, i.e.,

$$xs @ (ys @ zs) = (xs @ ys) @ zs$$

## Proof.

Blackboard

# Structural Induction

## Usage

- ▶ can be used on every variant type
- ▶ base cases correspond to non-recursive constructors
- ▶ step cases correspond to recursive constructors

## Example

- ▶ lists
- ▶ trees
- ▶  $\lambda$ -terms
- ▶ ...

Summary of Week 7

**Fibonacci Numbers**

Tupling

Tail Recursion

# Mathematical

## Definition ( $n$ -th Fibonacci number)

$$fib\ n \stackrel{\text{def}}{=} \begin{cases} 1 & \text{if } n \leq 1 \\ fib(n-1) + fib(n-2) & \text{otherwise} \end{cases}$$

### Example

1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233,  
 377, 610, 987, 1597, 2584, 4181, 6765, 10946,  
 17711, 28657, 46368, 75025, 121393, 196418,  
 317811, 514229, 832040, 1346269, 2178309,  
 3524578, 5702887, 9227465, 14930352,  
 24157817, 39088169, 63245986, 102334155,  
 165580141, 267914296, 433494437, 701408733,

# OCaml

## Definition

```
let rec fib n = if n < 2 then 1 else fib (n - 1) + fib (n - 2);;
```

## Example

# Overview

## Week 8 - Efficiency

Summary of Week 7

Fibonacci Numbers

**Tupling**

Tail Recursion

# Combining Several Results

## Idea

- ▶ use tuples to return more than one result
- ▶ make results available as return values instead of recomputing them

# Fibonacci Numbers

## Example

```
let rec fibpair n =  
  if n < 1 then (0, 1) else if n = 1 then (1, 1)  
    else let (f1, f2) = fibpair (n - 1) in (f2, f1 + f2)  
;;
```

- ▶ this function is **linear**

## Lemma

$$\text{fibpair } n = (\text{fib } (n - 1), \text{fib } n)$$

## Proof.

Blackboard

## A Second Example

### Goal

compute average value of an integer list

### Approach 1

- ▶ `let average xs = IntLst.sum xs / Lst.length xs;;`
- ▶ 2 traversals of `xs` are done

### Combined Function

- ▶  

```
let rec sumlen = function  
  | [] -> (0, 0)  
  | x :: xs -> let (s, l) = sumlen xs in (x + s, l + 1)  
;;
```
- ▶ one traversal of `xs` suffices

# Overview

Summary of Week 7

Fibonacci Numbers

Tupling

Tail Recursion

# Recursion vs. Tail Recursion

## Idea

- ▶ a function calling itself is **recursive**
- ▶ functions that mutually call each other are **mutually recursive**
- ▶ special kind of recursion is **tail recursion**

## Definition (Tail recursion)

a function is called **tail recursive** if the last action in the function body is the recursive call

# Examples

## Length

```
▶ let rec length = function  
  | [] -> 0  
  | x :: xs -> 1 + length xs  
  ;;
```

▶ not tail recursive

## Examples (cont'd)

### Even/Odd

```
let rec is_even = function  
  | 0 -> true  
  | 1 -> false  
  | n -> is_odd (n - 1)  
and is_odd = function  
  | 0 -> false  
  | 1 -> true  
  | n -> is_even (n - 1)  
;;
```

- ▶ mutually recursive (btw: also tail recursive)

## Examples (cont'd)

### Reverse

- ▶  

```
let rev xs =  
  let rec rev acc = function  
    | [] -> acc  
    | x :: xs -> rev (x :: acc) xs  
  in rev [] xs  
;;
```
- ▶ tail recursive

# Parameter Accumulation

## Idea

- ▶ make function tail recursive
- ▶ provide data as input instead of computing it before recursive call
- ▶ Why? (tail recursive functions can automatically be transformed into space-efficient loops)

# Example

## Average

```
let sumlen xs =  
  let rec sumlen sum len = function  
    | [] -> (sum, len)  
    | x :: xs -> sumlen (x + sum) (len + 1) xs  
  in sumlen 0 0 xs  
;;
```

- ▶ tail recursive
