Induction on Lists

Induction Principle (without Types)

$$\underbrace{(P([]))}_{\text{base case}} \wedge \underbrace{\forall x. \forall xs. (P(xs) \rightarrow P(x :: xs))}_{\text{step case}} \rightarrow \forall ls. P(ls)$$

Lemma

@ is associative, i.e.,

$$xs @ (ys @ zs) = (xs @ ys) @ zs$$

Proof.

Mathematical Induction

Induction Principle

$$\underbrace{(P(m))}_{\text{base case}} \wedge \underbrace{\forall k \geq m. (P(k) \rightarrow P(k+1))}_{\text{step case}} \rightarrow \forall n \geq m. P(n)$$

Example

- ▶ first domino will fall
- ▶ if a domino falls also its right neighbor falls

Structural Induction

Usage

- ▶ can be used on every variant type
- ▶ base cases correspond to non-recursive constructors
- ▶ step cases correspond to recursive constructors

Example

- ▶ lists
- ▶ trees
- ▶ λ-terms
- ▶ ...

This Week

Practice I

OCaml introduction, lists, strings, trees

Theory I

lambda-calculus, evaluation strategies, induction, reasoning about functional programs

Practice II

efficiency, tail-recursion, combinator-parsing

Theory II

type checking, type inference

Advanced Topics

lazy evaluation, infinite data structures, monads, ...

Mathematical (cont'd)

Example

1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181, 6765, 10946, 17711, 28657, 46368, 75025, 121393, 196418, 317811, 514229, 832040, 1346269, 2178309, 3524578, 5702887, 9227465, 14930352, 24157817, 39088169, 63245986, 102334155, 165580141, 267914296, 433494437, 701408733, 1134903170, 1836311903, 2971215073, ...

Mathematical Definition (n -th Fibonacci number)

$$\text{fib } n \stackrel{\text{def}}{=} \begin{cases} 1 & \text{if } n \leq 1 \\ \text{fib}(n-1) + \text{fib}(n-2) & \text{otherwise} \end{cases}$$

Graph

OCaml

Definition

```
let rec fib n = if n < 2 then 1 else fib(n-1) + fib(n-2)
```

Example

Combining Several Results

Idea

- ▶ use tuples to return more than one result
- ▶ make results available as return values instead of recomputing them

A Second Example

Goal

compute average value of an integer list

Approach 1

- ▶ `let average xs = IntLst.sum xs / Lst.length xs`
- ▶ 2 traversals of `xs` are done

Combined Function

- ▶

```
let rec sumlen = function
  | []      -> (0,0)
  | x::xs -> let (s,l) = sumlen xs in (x+s,l+1)
```

- ▶ one traversal of `xs` suffices

Fibonacci Numbers

Example

```
let rec fibpair n = if n < 1 then (0,1) else (
  if n = 1 then (1,1)
  else let (f1,f2) = fibpair (n-1) in (f2,f1+f2)
)
```

- ▶ this function is **linear**

Lemma

$$\text{fibpair}(n+1) = (\text{fib } n, \text{fib}(n+1))$$

Proof.

Blackboard □

Recursion vs. Tail Recursion

Idea

- ▶ a function calling itself is **recursive**
- ▶ functions that mutually call each other are **mutually recursive**
- ▶ special kind of recursion is **tail recursion**

Definition (Tail recursion)

a function is called **tail recursive** if the last action in the function body is the recursive call

Examples

Length

- ▶

```
let rec length = function [] -> 0
                       | x::xs -> 1 + length xs
```
- ▶ not tail recursive

Examples (cont'd)

Even/Odd

- ▶

```
let rec is_even = function 0 -> true
                        | 1 -> false
                        | n -> is_odd(n-1)
and is_odd      = function 0 -> false
                        | 1 -> true
                        | n -> is_even(n-1)
```
- ▶ mutually recursive (btw: also tail recursive)

Examples (cont'd)

Reverse

- ▶

```
let rev xs =
  let rec rev acc = function
    | [] -> acc
    | x::xs -> rev (x::acc) xs
  in
  rev [] xs
```
- ▶ tail recursive

Parameter Accumulation

Idea

- ▶ make function tail recursive
- ▶ provide data as input instead of computing it before recursive call
- ▶ Why? (tail recursive functions can automatically be transformed into space-efficient loops)

Example

Average

```
▶  
let sumlen xs =  
  let rec sumlen sum len = function  
    | []      -> (sum,len)  
    | x::xs  -> sumlen (x+sum) (len+1) xs  
  in  
    sumlen 0 0 xs
```

▶ tail recursive
