week 6

λ -Calculus (cont'd)

β -Reduction

the term s (β -)reduces to the term t in one step, i.e.,

$$\underbrace{s \rightarrow t}_{(\beta\text{-})\text{step}}$$

iff there exist context C and terms u, v s.t.

$$s = C[(\lambda x.u) v] \quad \text{and} \quad t = C[u\{x/v\}]$$

Example

$$K \stackrel{\text{def}}{=} \lambda xy.x$$

$$I \stackrel{\text{def}}{=} \lambda x.x$$

$$\Omega \stackrel{\text{def}}{=} (\lambda x.x x) (\lambda x.x x)$$

λ -Calculus

λ -Terms

$$t ::= \underbrace{x}_{\text{Variable}} \mid \underbrace{(\lambda x.t)}_{\text{Abstraction}} \mid \underbrace{(t t)}_{\text{Application}}$$

Example

$x y$	$(x y)$	" x applied to y "
$\lambda x.x$	$(\lambda x.x)$	"lambda x to x "
$\lambda xy.x$	$(\lambda x.(\lambda y.x))$	"lambda $x y$ to x "
$\lambda x.x x$	$(\lambda x.(x x))$	"lambda x to (x applied to x)"
$(\lambda x.x) x$	$((\lambda x.x) x)$	"(lambda x to x) applied to x "

This Week

Practice I

OCaml introduction, lists, strings, trees

Theory I

lambda-calculus, evaluation strategies, induction, reasoning about functional programs

Practice II

efficiency, tail-recursion, combinator-parsing

Theory II

type checking, type inference

Advanced Topics

lazy evaluation, infinite data structures, monads, ...

Booleans and Conditionals

OCaml

- ▶ **true**
- ▶ **false**
- ▶ **if** b **then** t **else** e

 λ -Calculus

- ▶ $\text{true} \stackrel{\text{def}}{=} \lambda xy.x$
- ▶ $\text{false} \stackrel{\text{def}}{=} \lambda xy.y$
- ▶ $\text{if} \stackrel{\text{def}}{=} \lambda xyz.x y z$

Example

$$\begin{aligned} \text{if true } t e &\rightarrow_{\beta}^+ \text{true } t e \rightarrow_{\beta}^+ t \\ \text{if false } t e &\rightarrow_{\beta}^+ \text{false } t e \rightarrow_{\beta}^+ e \end{aligned}$$

Natural Numbers

Definition

$$s^0 t \stackrel{\text{def}}{=} t \qquad s^{n+1} t \stackrel{\text{def}}{=} s (s^n t)$$

OCaml vs. λ -Calculus

$$\begin{aligned} 0 &\stackrel{\text{def}}{=} \lambda fx.x \\ 1 &\stackrel{\text{def}}{=} \lambda fx.f x \\ n &\stackrel{\text{def}}{=} \lambda fx.f^n x \\ (+) &\stackrel{\text{def}}{=} \lambda mnfx.m f (n f x) \\ (*) &\stackrel{\text{def}}{=} \lambda mnf.m (n f) \\ (**) &\stackrel{\text{def}}{=} \lambda mn.n m \end{aligned}$$

Example

$$\text{add } \bar{1} \bar{1} \rightarrow_{\beta}^* \bar{2}$$

Pairs

OCaml vs. λ -Calculus

$$\begin{aligned} \text{fun } x y \rightarrow (x,y) &\quad \text{pair} \stackrel{\text{def}}{=} \lambda xyf.f x y \\ \text{fst} &\quad \text{fst} \stackrel{\text{def}}{=} \lambda p.p \text{ true} \\ \text{snd} &\quad \text{snd} \stackrel{\text{def}}{=} \lambda p.p \text{ false} \end{aligned}$$

Example

$$\text{fst (pair } \bar{m} \bar{n}) \rightarrow_{\beta}^* \bar{m}$$

Lists

OCaml vs. λ -Calculus

$$\begin{aligned} :: &\quad \text{cons} \stackrel{\text{def}}{=} \lambda xy.\text{pair false (pair } x y) \\ \text{hd} &\quad \text{hd} \stackrel{\text{def}}{=} \lambda z.\text{fst (snd } z) \\ \text{tl} &\quad \text{tl} \stackrel{\text{def}}{=} \lambda z.\text{snd (snd } z) \\ [] &\quad \text{nil} \stackrel{\text{def}}{=} \lambda x.x \\ \text{fun } x \rightarrow x = [] &\quad \text{null} \stackrel{\text{def}}{=} \text{fst} \end{aligned}$$

Example

$$\text{null nil} \rightarrow_{\beta}^* \text{true}$$

Recursion

OCaml

```
let rec length x = if x = [] then 0
                  else 1 + length(tl x)
```

λ-Calculus

$$\text{length} \stackrel{\text{def}}{=} \mathbf{Y} (\lambda f x. \text{if } (\text{null } x) \bar{0} (\text{add } \bar{1} (f (\text{tl } x))))$$

Definition (Y-combinator)

$$\mathbf{Y} \stackrel{\text{def}}{=} \lambda f. (\lambda x. f (x x)) (\lambda x. f (x x))$$

Y has **fixed point property**, i.e., for all $t \in \mathcal{T}(\mathcal{V})$

$$\mathbf{Y} t \leftrightarrow^* t (\mathbf{Y} t)$$

Example

- ▶ consider `let d x = x + x`
- ▶ the term `d (d 2)` can be evaluated as follows (9 possibilities)

Strategies

Strategy

- ▶ fixes evaluation order
- ▶ examples: **call-by-value** and **call-by-name**

Example

```
let d x = x + x
```

▶ call-by-value:

$$\begin{aligned} d (d 2) &\rightarrow d (2+2) \\ &\rightarrow d 4 \\ &\rightarrow 4 + 4 \\ &\rightarrow 8 \end{aligned}$$

▶ call-by-name:

$$\begin{aligned} d (d 2) &\rightarrow (d 2)+(d 2) \\ &\rightarrow (2+2)+(d 2) \\ &\rightarrow 4+(d 2) \\ &\rightarrow 4+(2+2) \\ &\rightarrow 4+4 \\ &\rightarrow 8 \end{aligned}$$

(Leftmost) Innermost Reduction

- ▶ always reduce leftmost innermost redex

Definition

redex t of term u is **innermost** if it does not contain a redex as **proper** subterm, i.e.,

$$\nexists s \in \text{Sub}(t) \text{ s.t. } s \neq t \text{ and } s \text{ is a redex}$$

Example

Consider $t = (\lambda x. (\lambda y. y) x) z$

- ▶ $(\lambda y. y) x$ is innermost redex
- ▶ $(\lambda x. (\lambda y. y) x) z$ is redex, but not innermost

(Leftmost) Outermost Reduction

- ▶ always reduce leftmost outermost redex

Definition

redex t of term u is **outermost** if it is not a **proper** subterm of some other redex in u , i.e.,

$$\nexists s \in \text{Sub}(u) \text{ s.t. } s \text{ is a redex and } t \in \text{Sub}(s) \text{ and } s \neq t$$

Example

Consider $t = (\lambda x. (\lambda y. y) x) z$

- ▶ $(\lambda x. (\lambda y. y) x) z$ is outermost redex
- ▶ $(\lambda y. y) x$ is redex, but not outermost

Call-by-Name

- ▶ use outermost reduction
- ▶ corresponds to lazy evaluation (without memoization), e.g., Haskell
- ▶ slight modification: only reduce terms that are not in WHNF

Call-by-Value

- ▶ use innermost reduction
- ▶ corresponds to strict (or eager) evaluation, e.g., OCaml
- ▶ slight modification: only reduce terms that are not in WHNF

Definition (Weak head normal form)

term t is in **weak head normal form (WHNF)** iff

$$t \neq u v$$

Example (WHNF)

$\lambda x. x$ ✓ $(\lambda x. x) y$ ✗ $(\lambda x. x) y z$ ✗ $\lambda x. (\lambda y. y) x$ ✓ $x x$ ✗

λ Tree Tool

developed by Stefan Widerin in [bachelor project](#)

λ -Terms

$$t ::= x \mid (\lambda x. t) \mid (t t)$$

Conventions

- ▶ nested abstractions use spaces to separate variable names, e.g.,

$$\begin{aligned} \lambda xy. x & \quad \lambda x y. x \\ \lambda x_1. y & \quad \lambda x_1. y \end{aligned}$$

Result

Animator

- ▶ animation of β -steps
- ▶ innermost/outermost
- ▶ leftmost/rightmost

Output

- ▶ reduction sequence to NF
- ▶ innermost/outermost
- ▶ leftmost/rightmost
