

# Functional Programming

WS 2013/14

Harald Zankl (VO+PS)  
Cezary Kaliszyk (PS)

Computational Logic  
Institute of Computer Science  
University of Innsbruck

week 8

# Mathematical Induction

## Induction Principle

$$\underbrace{(P(m))}_{\text{base case}} \wedge \underbrace{\forall k \geq m. (P(k) \rightarrow P(k+1))}_{\text{step case}} \rightarrow \forall n \geq m. P(n)$$

## Example

- ▶ first domino will fall
- ▶ if a domino falls also its right neighbor falls

# Induction on Lists

## Induction Principle (without Types)

$$\underbrace{(P([\ ]))}_{\text{base case}} \wedge \underbrace{\forall x. \forall xs. (P(xs) \rightarrow P(x :: xs))}_{\text{step case}} \rightarrow \forall ls. P(ls)$$

## Lemma (append is associative)

$$xs @ (ys @ zs) = (xs @ ys) @ zs$$

where

```
let rec (@) xs ys = match xs with
| []      -> ys
| x::xs  -> x :: (xs @ ys)
```

Proof.

Blackboard

# Structural Induction

## Usage

- ▶ can be used on every variant type
- ▶ base cases correspond to non-recursive constructors
- ▶ step cases correspond to recursive constructors

## Example

- ▶ lists
- ▶ trees
- ▶  $\lambda$ -terms
- ▶ ...

# This Week

## Practice I

OCaml introduction, lists, strings, trees

## Theory I

lambda-calculus, evaluation strategies, induction,  
reasoning about functional programs

## Practice II

efficiency, tail-recursion, combinator-parsing, dynamic programming

## Theory II

type checking, type inference

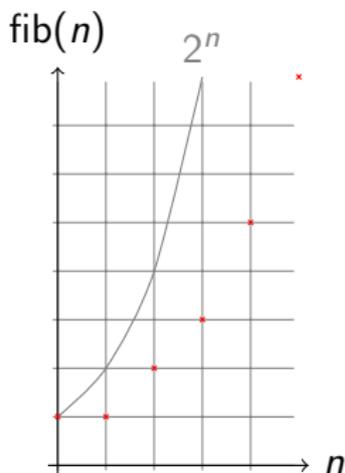

## Advanced Topics

lazy evaluation, infinite data structures, monads, ...

# Mathematical Definition ( $n$ -th Fibonacci number)

$$\text{fib}(n) \stackrel{\text{def}}{=} \begin{cases} 1 & \text{if } n \leq 1 \\ \text{fib}(n-1) + \text{fib}(n-2) & \text{otherwise} \end{cases}$$

## Graph

# Mathematical (cont'd)

## Example

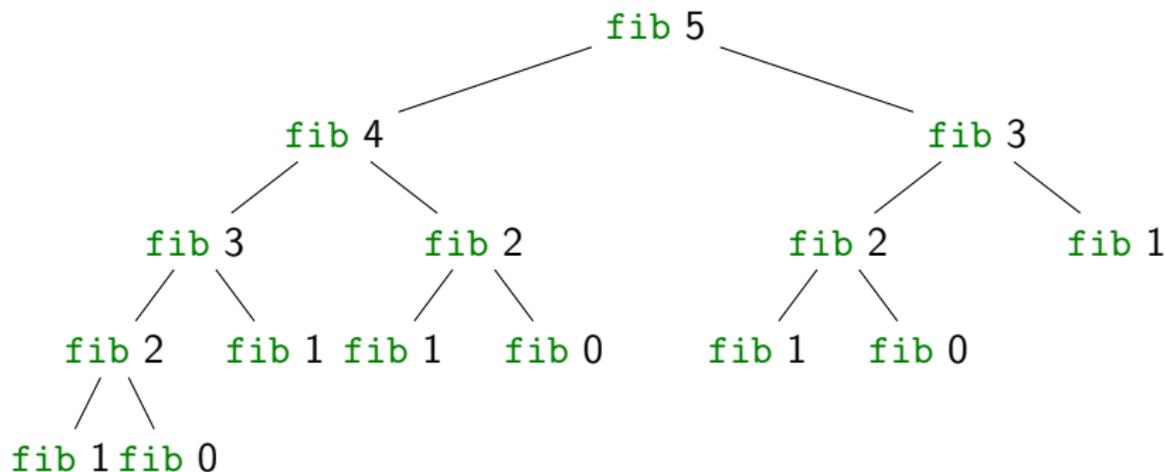

1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, 1597, 2584, 4181, 6765, 10946, 17711, 28657, 46368, 75025, 121393, 196418, 317811, 514229, 832040, 1346269, 2178309, 3524578, 5702887, 9227465, 14930352, 24157817, 39088169, 63245986, 102334155, 165580141, 267914296, 433494437, 701408733, 1134903170, 1836311903, 2971215073, ...

# OCaml

## Definition

```
let rec fib n = if n < 2 then 1 else fib(n-1) + fib(n-2)
```

## Example

# Tupling

## Idea

- ▶ use tuples to return more than one result
- ▶ make results available as return values instead of recomputing them

# Fibonacci Numbers

## Example

```
let rec fibpair n = if n < 1 then (0,1) else (  
  if n = 1 then (1,1)  
    else let (f1,f2) = fibpair (n-1) in (f2,f1+f2)  
)
```

- ▶ this function is **linear**

## Lemma

$$\text{fibpair}(n + 1) = (\text{fib } n, \text{fib}(n + 1))$$

## Proof.

Blackboard

# A Second Example

## Goal

compute average value of an integer list (module IntLst)

## Naive Approach

- ▶ `let average xs = sum xs / Lst.length xs`
- ▶ 2 traversals of `xs` are done

## Combined Function

- ▶ `let rec sumlen = function`
  - | `[]` → `(0,0)`
  - | `x::xs` → `let (sum,len) = sumlen xs in (sum+x,len+1)`
- ▶ `let average1 xs = let (sum,len) = sumlen xs in sum/len`
- ▶ one traversal of `xs` suffices

# Recursion vs. Tail Recursion

## Idea

- ▶ a function calling itself is **recursive**
- ▶ functions that mutually call each other are **mutually recursive**
- ▶ special kind of recursion is **tail recursion**

## Definition (Tail recursion)

a function is called **tail recursive** if the recursive call is last action in the function body

## Reward

<http://xkcd.com/1270/>

# Examples

## Length

```
▶ let rec length = function []      -> 0
                          | _::xs -> 1 + length xs
```

▶ not tail recursive

## Even/Odd

```
▶ let rec is_even = function 0 -> true
                              | 1 -> false
                              | n -> is_odd(n-1)
  and is_odd      = function 0 -> false
                              | 1 -> true
                              | n -> is_even(n-1)
```

▶ mutually recursive (btw: also tail recursive)

# Parameter Accumulation

## Idea

- ▶ make function tail recursive
- ▶ provide data as input instead of computing it before recursive call
- ▶ Why? (tail recursive functions can automatically be transformed into space-efficient loops)

## Example (Sumlen)

```
▶ let rec sumlen = function  
  | []      -> (0,0)  
  | x::xs -> let (sum,len) = sumlen xs in (sum+x,len+1)
```

▶ **not** tail recursive

```
▶ let sumlen_tl xs =  
  let rec sumlen sum len = function  
    | []      -> (sum,len)  
    | x::xs -> sumlen (sum+x) (len+1) xs  
  in  
  sumlen 0 0 xs
```

▶ tail recursive

```
▶ let sumlen_fold xs =  
  Lst.foldl1 (fun (sum,len) x -> (sum+x,len+1)) (0,0) xs
```

▶ tail recursive

# Examples (Reverse)

- ▶ `let rec reverse = function [] -> []  
                                  | x::xs -> (reverse xs) @ [x]`
- ▶ **not** tail recursive
- ▶ `let rev xs =  
    let rec rev acc = function [] -> acc  
                                  | x::xs -> rev (x::acc) xs  
    in  
    rev [] xs`
- ▶ tail recursive
- ▶ `let rev xs = Lst.foldl (fun acc x -> x::acc) [] xs`
- ▶ tail recursive
