## Summary of Last Lecture

## Example

ancestor_of(Ancestor, Descendant) :- child_of(Descendant, Ancestor). ancestor_of(Ancestor, Descendant) :child_of(Person, Ancestor), ancestor_of(Person, Descendant).

## Example

ancestor_of_2 (Ancestor, Descendant) :child_of(Descendant, Ancestor). ancestor_of_2 (Ancestor, Descendant) :ancestor_of_2(Person, Descendant), child_of(Person, Ancestor).

## Outline of the Lecture

Monotone Logic Programs
introduction, basic constructs, logic foundations, unification, semantics, database and recursive programming, termination, complexity

## Incomplete Data Structures and Constraints

 incomplete data structures, definite clause grammars, constraint logic programming, answer set programming
## Full Prolog

semantics (revisted), correctness proofs, meta-logical predicates, cuts nondeterministic programming, efficient programs, complexity

# Non-Monotonic Reasoning 

```
Definition
an operator \(\Psi\) is called monotone if \(A \subseteq B\) implies \(\Psi(A) \subseteq \Psi(B)\)
```

## Non-Monotonic Reasoning

## Definition

an operator $\Psi$ is called monotone if $A \subseteq B$ implies $\Psi(A) \subseteq \Psi(B)$

## Fact

suppose $\Psi$ acts on sets of formulas and interprets the consequence relation of a logic program $P$ without negation, then $\Psi$ is monotone

Definition
a monotone logic program is a logic program without negation $(\backslash+)$

## Monotonicity Criticism

## Example (Minsky's Example)

```
on(a,b).
on(d,a).
on(d,c).
clear(Y) :-
    not_exists_x_on(Y).
not_exists_x_on(Y) :-
    on(_X,Y), !, fail.
not_exists_x_on(_Y).
```

## Monotonicity Criticism

```
Example (Minsky's Example)
on(a,b ).
on(d,a ).
on(d,c).
clear(Y) :-
    not_exists_x_on(Y).
not_exists_x_on(Y) :-
    on(_X,Y), !, fail.
not_exists_x_on(_Y).
```

Observations

- in this block-world example :- clear (d) holds
- but monotoncity doesn't; addition of the fact on(e,d). renders
:- clear (d) false

such that $\sigma^{\prime}$ is at least as general as $\sigma$ (with respect to variables in $G$ )

## Search or SLD Trees

Definition
a search tree (aka SLD tree) of a goal $G$ is a tree $T$ such that

- the root of $T$ is labelled with $G$
- the nodes of $T$ are labelled with conjunctions of goals, where one goal is selected (wrt a selection function)

## Remark

a search tree captures all possible SLD derivations wrt a given goal and selection function

## Declarative Reading

## Definition

the declarative reading of a program is its concept as (set of) logical formulas

## Declarative Reading

## Definition

the declarative reading of a program is its concept as (set of) logical formulas

Analysis
1 specialisation

- if we remove clauses of a defined relation, then this relation becomes smaller; the program is specialised
- if the specialisation provides wrong answers, the original program certainly will

## Declarative Reading

## Definition

the declarative reading of a program is its concept as (set of) logical formulas

Analysis
1 specialisation

- if we remove clauses of a defined relation, then this relation becomes smaller; the program is specialised
- if the specialisation provides wrong answers, the original program certainly will
2 generalisation
- if we remove goals from the body of a clause, the relation is extended; the program is generalised
- if the generalised program cannot derive correct facts, the original can neither

## Definition

- to define complex types, recursive logic programs may be necessary
- the latter types are called recursive types
- recursive types, defined by unary recursive programs, are called simple recursive types
- a program defining a type is a type definition; a call to a predicate defining a type is a type condition
