# Logic Programming 

Georg Moser

Department of Computer Science @ UIBK
Winter 2016

## Summary of Last Lecture

## Definitions (CLP on finite domains)

- use_module(library (clpfd)) loads the clpfd library
- Xs ins N .. M specifies that all values in $X s$ must be in the given range
- all_different(Xs) specifies that all values in $X$ s are different
- label(Xs) all variables in $X$ s are evaluated to become values
- \#=, \# $\backslash=$, \#>, . . like the arithmetic comparison operators, but may contain (constraint) variables
standard approach
- load the library
- specify all constraints
- call label to start efficient computation of solutions

## Outline of the Lecture

Monotone Logic Programs
introduction, basic constructs, logic foundations, unification, semantics, database and recursive programming, termination, complexity

## Incomplete Data Structures and Constraints

 incomplete data structures, definite clause grammars, constraint logic programming, answer set programming
## Full Prolog

semantics (revisted), correctness proofs, meta-logical predicates, cuts nondeterministic programming, efficient programs, complexity

## Outline of the Lecture

Monotone Logic Programs
introduction, basic constructs, logic foundations, unification, semantics, database and recursive programming, termination, complexity

## Incomplete Data Structures and Constraints

 incomplete data structures, definite clause grammars, constraint logic programming, answer set programming
## Full Prolog

semantics (revisted), correctness proofs, meta-logical predicates, cuts nondeterministic programming, efficient programs, complexity

## Performance

> "Neng-Fa Zhou, the author of B-Prolog, has kindly integrated our constraint solver in his benchmarks, available from http: //www. probp. com/performance. htm. The results show that our solver is on average two orders of magnitude slower on these benchmarks than the fastest system (B-Prolog itself), and about 30 times slower than the constraint solver of SICStus Prolog." ${ }^{1}$

[^0]
## Example

a $n \times n$ square is magic if cells contain $\left\{1, \ldots, n^{2}\right\}$ and the row sums, the column sums and the sums of both diagonals are all equal
$\qquad$

$\qquad$ | (20020

## Example

a $n \times n$ square is magic if cells contain $\left\{1, \ldots, n^{2}\right\}$ and the row sums, the column sums and the sums of both diagonals are all equal

## Example

```
magicsquare3(Xs) :-
    magicsquare3_(Xs,Ys),
    labeling([],Ys).
```

magicsquare3_([[X1, X2, X3] ,[X4, X5, X6] ,[X7, X8, X9]], Ys ) :-
$\mathrm{Ys}=[\mathrm{X} 1, \mathrm{X} 2, \mathrm{X} 3, \mathrm{X} 4, \mathrm{X} 5, \mathrm{X} 6, \mathrm{X} 7, \mathrm{X} 8, \mathrm{X} 9]$,
Ys ins 1..9,
all_different(Ys),
$\mathrm{X} 1+\mathrm{X} 2+\mathrm{X} 3$ \# $\mathrm{N}, \mathrm{X} 4+\mathrm{X} 5+\mathrm{X} 6 \#=\mathrm{N}$,
$\mathrm{X} 7+\mathrm{X} 8+\mathrm{X} 9$ \# N ,
$\mathrm{X} 1+\mathrm{X} 4+\mathrm{X} 7 \# \mathrm{~N}, \mathrm{X} 2+\mathrm{X} 5+\mathrm{X} 8 \# \mathrm{~N}$,
$\mathrm{X} 3+\mathrm{X} 6+\mathrm{X} 9 \# N$,
$\mathrm{X} 1+\mathrm{X} 5+\mathrm{X} 9 \# \mathrm{~N}, \mathrm{X} 7+\mathrm{X} 5+\mathrm{X} 3 \# \mathrm{~N}$.

## Example

/* magic square + bit math: $N=n *\left(n^{\wedge} 2+1\right) / 2 * /$
magicsquare3_2(Xs) :-
magicsquare3_(Xs,Ys),
labeling ([], Ys).
magicsquare3_2_([[X1,X2,X3],[X4,X5,X6],[X7,X8,X9]],Ys):-
$Y s=[X 1, X 2, X 3, X 4, X 5, X 6, X 7, X 8, X 9]$,
Ys ins 1..9,
all_different(Ys),
N \# $=15$,
$\mathrm{X} 1+\mathrm{X} 2+\mathrm{X} 3$ \# N, X4 + X5 + X6 \# N,
$\mathrm{X} 7+\mathrm{X} 8+\mathrm{X} 9$ \# N ,
$\mathrm{X} 1+\mathrm{X} 4+\mathrm{X} 7 \# \mathrm{~N}, \mathrm{X} 2+\mathrm{X} 5+\mathrm{X} 8 \# \mathrm{~N}$,
X3 $+\mathrm{X} 6+\mathrm{X} 9$ \# N ,
$\mathrm{X} 1+\mathrm{X} 5+\mathrm{X} 9 \# \mathrm{~N}, \mathrm{X} 7+\mathrm{X} 5+\mathrm{X} 3 \# \mathrm{~N}$.

## Example

remove symmetric solutions, due to rotations and mirroring

## Example

```
magicsquare3nred(Xs) :-
    magicsquare3nred_(Xs,Ys),
    labeling([],Ys).
```

```
magicsquare3nred_(Xs,Ys) :-
```

magicsquare3nred_(Xs,Ys) :-
magicsquare3_(Xs,Ys) ,
magicsquare3_(Xs,Ys) ,
Ys = [X1,X2,X3,X4, X X5,X6, _X7,X8,X9],
Ys = [X1,X2,X3,X4, X X5,X6, _X7,X8,X9],
X1 \#> X3,
X1 \#> X3,
X6 \#> X9,
X6 \#> X9,
X2 \#> X4,
X2 \#> X4,
X6 \#> X8.

```
    X6 #> X8.
```

:- time (magicsquare $3 \mathrm{nred}\left(\_\mathrm{Xs}\right)$ ).
\% 177,052 inferences, 0.060 CPU in 0.060 seconds
\% proper testing shows even speed up over clever variant

## Efficient Constraint Logic Programmming

Strategies for Solutions

- take termination seriously non-termination is a sign of inefficiency
- choose suitable labeling strategies
- use system predicates

$$
\begin{aligned}
& :-Z s=[A, B, C], Z s \text { ins } 1 \ldots 2, \\
& A \# \backslash=B, B \# \backslash=C, A \# \backslash C \\
& : /-Z s=[A, B, C], Z s \text { ins } 1 . .2, \\
& \text { all_different }(Z s) .
\end{aligned}
$$

- make use of redundant constraints
recall the magic square example, where the sums equal
$n \cdot\left(n^{2}+1\right) / 2$; using this redundant constraint, the search may be quicker; however, such constraints are difficult to find

## Labeling Strategies

## Strategies for Solutions (cont'd)

- minimise the solution space consider the exclusion of rotations and symmetries for magic square
- improve representation of solutions inefficient/redundant representations increase the solution space unnecessarily

## Labeling Strategies

Strategies for Solutions (cont'd)

- minimise the solution space consider the exclusion of rotations and symmetries for magic square
- improve representation of solutions
inefficient/redundant representations increase the solution space unnecessarily

## Definition

labeling (+Options,+Vars) assign a value to each variable in Vars; three categories of options exist

- variable selection strategy
- value order strategy
- branching strategy

## Definition (variable selection strategy)

- leftmost, select the variables in the order they occur in Vars (default)

## Definition (variable selection strategy)

- leftmost, select the variables in the order they occur in Vars (default)
- min, select the leftmost variable with lowest lower bound next

$$
\begin{aligned}
& :-X \text { in } 1 \ldots 2, Y \text { in } 3 \ldots 4, \text { labeling }([\min ],[X, Y]) . \\
& X=1, Y=3 ; \\
& X=1, Y=4 ; \\
& X=2, Y=3 ; \\
& X=2, Y=4
\end{aligned}
$$

## Definition (variable selection strategy)

- leftmost, select the variables in the order they occur in Vars (default)
- min, select the leftmost variable with lowest lower bound next

$$
\begin{aligned}
& :-X \text { in } 1 \ldots 2, Y \text { in } 3 \ldots 4, \text { labeling }([\min ],[X, Y]) . \\
& X=1, Y=3 ; \\
& X=1, Y=4 ; \\
& X=2, Y=3 ; \\
& X=2, Y=4
\end{aligned}
$$

- max, select the leftmost variable with highest upper bound next

$$
\begin{aligned}
& :-X \text { in } 1 \ldots 2, Y \text { in } 3 \ldots 4, \text { labeling }([\min ],[X, Y]) . \\
& X=1, Y=3 ; \\
& X=2, Y=3 ; \\
& X=1, Y=4 ; \\
& X=2, Y=4
\end{aligned}
$$

## Definition (variable selection strategy)

- leftmost, select the variables in the order they occur in Vars (default)
- min, select the leftmost variable with lowest lower bound next

$$
\begin{aligned}
& :-X \text { in } 1 \ldots 2, Y \text { in } 3 \ldots 4, \text { labeling }([\min ],[X, Y]) \\
& X=1, Y=3 ; \\
& X=1, Y=4 ; \\
& X=2, Y=3 \\
& X=2, Y=4
\end{aligned}
$$

- max, select the leftmost variable with highest upper bound next

$$
\begin{aligned}
& :-X \text { in } 1 \ldots 2, Y \text { in } 3 \ldots 4, \text { labeling }([\min ],[X, Y]) . \\
& X=1, Y=3 ; \\
& X=2, Y=3 ; \\
& X=1, Y=4 ; \\
& X=2, Y=4
\end{aligned}
$$

- ff, first fail, select the leftmost variable with smallest domain next, in order to detect infeasibility early

## Definition (variable selection strategy (cont'd))

- ffc, from the variables with smallest domain, select the one occurring most often in constraints

## Definition (variable selection strategy (cont'd))

- ffc, from the variables with smallest domain, select the one occurring most often in constraints

Definition (value order strategy)

- up, try the elements of the domain in ascending order
- down, in descending order

## Definition (variable selection strategy (cont'd))

- ffc, from the variables with smallest domain, select the one occurring most often in constraints

## Definition (value order strategy)

- up, try the elements of the domain in ascending order
- down, in descending order

## Definition (branching strategy)

- step, for each variable $X$, the choice is between $X=V$ and $X \# \backslash=$ $V$ ( $V$ determined by value order)
- enum, enumerate the domain of $X$ according to the value order
- bisect, choice is between $X \backslash \#=<M$ and $X \backslash \#>M$ ( $M$ the midpoint of the domain)

## The New Kid on the Block

Answer Set Programming

- novel approach to modelling and solving search and optimisation problems
- $\neg$ programming, but a specification language
- $\neg$ Turing complete
- purely declarative
- restricted to finite models

## The New Kid on the Block

Answer Set Programming

- novel approach to modelling and solving search and optimisation problems
- $\neg$ programming, but a specification language
- $\neg$ Turing complete
- purely declarative
- restricted to finite models

## Success Stories

- team building for cargo at Gioia Tauro Seaport

## The New Kid on the Block

Answer Set Programming

- novel approach to modelling and solving search and optimisation problems
- $\neg$ programming, but a specification language
- $\neg$ Turing complete
- purely declarative
- restricted to finite models

## Success Stories

- team building for cargo at Gioia Tauro Seaport
- expert system in space shuttle

## The New Kid on the Block

- natural language processing

[^1]
## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before

## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before
- only constants (= propositions) are allowed as atoms

## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before
- only constants (= propositions) are allowed as atoms
- negation is negation as failure

## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before
- only constants (= propositions) are allowed as atoms
- negation is negation as failure
- disjunctions may appear in the head

## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before
- only constants (= propositions) are allowed as atoms
- negation is negation as failure
- disjunctions may appear in the head
- an answer set is a set of atoms corresponding to the minimal model of the program

## Propositional Setting

## Definitions

- atoms, facts, rules are defined as before
- only constants (= propositions) are allowed as atoms
- negation is negation as failure
- disjunctions may appear in the head
- an answer set is a set of atoms corresponding to the minimal model of the program

## Example (Negation as Failure)

light_on :- power_on, not broken.
power_on.
answer set: \{power_on, light_on\}

| Example (Disjunctive Heads) |
| :--- |
| open $\mid$ closed :- door. |
| answer sets: $\{$ open $\},\{$ closed $\}$ |

| Example (Disjunctive Heads) |
| :--- |
| open \| closed :- door. |
| answer sets: \{open $\},\{$ closed $\}$ |
| GM (Department of Computer Science @ UI |
| Logic Programming |

| Example (Disjunctive Heads) |
| :--- |
| open $\mid$ closed :- door. |
| answer sets: $\{$ open $\},\{$ closed $\}$ |

-
$\square$
$\square$
$\qquad$

Example (Disjunctive Heads)

## \section*{Ans} <br> \section*{\begin{abstract} $\qquad$ \end{abstract} <br> <br> (Dis <br> <br> open lased: <br> <br> ample

}
$\qquad$
$\qquad$
$\qquad$

$\qquad$
$\qquad$

$4 / 1$

## Example (Disjunctive Heads)

## Example

| $a$ | $b$ |
| :--- | :--- |
| $a$ | $c$ |

answer sets: $\{a\}$ and $\{b, c\}$
$\mathrm{a} \mid \mathrm{b}$.
a :- b.
answer set: $\{a\}$, but not $\{b\}$ nor $\{a, b\}$

# open | closed :- door. <br> answer sets: $\{$ open $\},\{$ closed $\}$ \} 

$$
\begin{array}{l|l}
\mathrm{a} & \mathrm{~b} . \\
\mathrm{a} & \mathrm{c} .
\end{array}
$$

$$
\mathrm{a}:-\mathrm{b} .
$$

$\qquad$
$a \mid b$
$a \quad:-b$

## Definition

constraints are negative assertions, representing fact that must not occur in any model of the program

## Definition

constraints are negative assertions, representing fact that must not occur in any model of the program

## Example

a : - not a, b.
any answer set must not contain $b$ and constraint simplifies to
:- b.
same notation, but different use than an assertion

## Definition

constraints are negative assertions, representing fact that must not occur in any model of the program

## Example

a : - not a, b.
any answer set must not contain $b$ and constraint simplifies to :- b.
same notation, but different use than an assertion

## Additional Features

- finite choice functions: $\left\{f a c t_{1}, f^{\prime}\right.$ act $\left.t_{2}, f_{\text {act }}^{3}\right\}$.
- choice and counting: $1\left\{\right.$ fact $_{1}$, fact $_{2}$, fact $\left._{3}\right\} 2$.
" 1 " or " 2 " may be missing

## First-Order Setting

## Definition

- extension of first-order language
- no function symbols

## First-Order Setting

## Definition

- extension of first-order language
- no function symbols

Example (3-colouring)

$$
\begin{aligned}
& \text { red }(X) \text { green }(X) \mid \text { blue }(X) . \\
& :- \text { red }(X), \text { red }(Y), \text { edge }(X, Y) . \\
& :- \text { green }(X), \text { green }(Y), \text { edge }(X, Y) . \\
& :- \text { blue }(X), \text { blue }(Y), \quad \text { edge }(X, Y) .
\end{aligned}
$$

## First-Order Setting

## Definition

- extension of first-order language
- no function symbols

## Example (3-colouring)

$$
\begin{aligned}
& \text { red }(X) \text { green }(X) \text { blue }(X) \text {. } \\
& :- \text { red }(X), \text { red }(Y), \text { edge }(X, Y) . \\
& :- \text { green }(X), \text { green }(Y), \text { edge }(X, Y) \text {. } \\
& :- \text { blue }(X), \quad \text { blue }(Y), \quad \text { edge }(X, Y) .
\end{aligned}
$$

Example ((part of) 8-queens problem)

$$
:-\operatorname{row}(X), \operatorname{not}(1=\operatorname{count}(Y: q u e e n(X, Y)))
$$

expresses that exactly one queen appears in every row and column

## Grounders and Solvers

## Prolog and Answer Set Programming

- proof search
- Turing complete
- control
- efficiency
- model search
- finite domain
- specification language
- generality

## Prolog and Answer Set Programming

- proof search
- Turing complete
- control
- efficiency
- model search
- finite domain
- specification language
- generality

## Example

```
hanoi(0, _, _, _,[]).
hanoi(N,X,Y,Z,Ls) :-
    N > 0,M is N - 1,
    hanoi(M, X,Z,Y,Ls0),
    append(Ls0 ,[move(N,X,Z)],Ls1),
    hanoi(M,Y,X,Z,Ls2),
    append(Ls1,Ls2,Ls).
```

## Example

disk(1..n).
transition (0.. pathlength -1 ).
location (Peg) :- peg (Peg). \#domain disk (X;Y). \#domain peg (P;P1;P2). \#domain transition (T). \#domain situation (I). \#domain location (L; L1).
on $(X, L, T+1):-\quad$ on $(X, L, T)$, not otherloc $(X, L, T+1)$.
otherloc $(X, L, I):-\quad$ on $(X, L 1, I), L 1!=L$.
$:-$ on $(X, L, I)$, on $(X, L 1, I), L!=L 1$.
inpeg $(X, P, I):-\quad$ on $(X, L, I)$, inpeg $(L, P, I) . \quad$ inpeg $(P, P, I)$.
top $(P, L, I):-\quad i n p e g(L, P, I)$, not covered $(L, I)$.
covered $(\mathrm{L}, \mathrm{I}):-$ on $(\mathrm{X}, \mathrm{L}, \mathrm{I})$.
$:-$ on $(X, Y, I), \quad X>Y$.
on $(X, L, T+1):-\operatorname{move}(P 1, P 2, T)$, top $(P 1, X, T), \operatorname{top}(P 2, L, T)$.
$:-\operatorname{move}(\mathrm{P} 1, \mathrm{P} 2, \mathrm{~T})$, top $(\mathrm{P} 1, \mathrm{P} 1, \mathrm{~T})$. movement $(\mathrm{P} 1, \mathrm{P} 2):-\mathrm{P} 1$ != P 2 .
1 \{move $(A, B, T): m o v e m e n t(A, B)\} 1$.
on ( $\mathrm{n}, \mathrm{a}, 0$ ).

$$
\text { on }(X, X+1,0):-X<n
$$

onewrong :- not inpeg ( $\mathrm{X}, \mathrm{c}, \mathrm{pathleng} \mathrm{th}$ ).
:- onewrong.
