

Computability Theory

Aart Middeldorp

Outline

- 1. Summary of Previous Lecture**
- 2. Loop Programs**
- 3. Elementary Functions**
- 4. Grzegorczyk Hierarchy**
- 5. Summary**

Definitions

- $\langle x_1, \dots, x_n \rangle = p_0^n \times p_1^{x_1} \times \dots \times p_n^{x_n}$ Gödel number
- $(x)_i = (\mu j < x) \neg(p_i^{j+1} \mid x)$
- $\text{len}(x) = (x)_0$
- $\text{seq}(x) \iff x > 0 \wedge (\forall i \leq x) [(x)_i \neq 0 \implies i \leq \text{len}(x)]$
- $x ; y = p_0^{\text{len}(x) + \text{len}(y)} \times \prod_{i < \text{len}(x)} p_{i+1}^{(x)_{i+1}} \times \prod_{i < \text{len}(y)} p_{\text{len}(x)+i+1}^{(y)_{i+1}}$

Lemma

PR is closed under course-of-values recursion:

if $g: \mathbb{N}^n \rightarrow \mathbb{N}$ and $h: \mathbb{N}^{n+2} \rightarrow \mathbb{N}$ are primitive recursive then

$$f(0, \vec{y}) = g(\vec{y})$$

$$f(x+1, \vec{y}) = h(\tilde{f}(x, \vec{y}), x, \vec{y})$$

with $\tilde{f}(x, \vec{y}) = \langle f(0, \vec{y}), \dots, f(x, \vec{y}) \rangle$ is primitive recursive

Definition (Ackermann function)

$$\text{ack}(0, y) = y + 1$$

$$\text{ack}(x + 1, 0) = \text{ack}(x, 1)$$

$$\text{ack}(x + 1, y + 1) = \text{ack}(x, \text{ack}(x + 1, y))$$

Lemma

\forall primitive recursive function $f: \mathbb{N}^n \rightarrow \mathbb{N}$ \exists constant $c \in \mathbb{N}$ such that

$$f(x_1, \dots, x_n) < \text{ack}(c, \max \{x_1, \dots, x_n\})$$

Theorem

Ackermann function is **not** primitive recursive

Definition

class \mathbf{R} of **recursive functions** is smallest class of **total** functions that contains all initial functions and is closed under composition, primitive recursion and **(unbounded) minimization**:

$$(\mu i) P(i, \vec{y}) = \min \{ i \mid P(i, \vec{y}) \} \in \mathbf{R}$$

for all $P: \mathbb{N}^{n+1} \rightarrow \mathbb{B}$ such that $\chi_P \in \mathbf{R}$ and $\forall \vec{y} \exists x P(x, \vec{y})$

Theorem

- \exists primitive recursive predicate $P: \mathbb{N} \rightarrow \mathbb{B}$ such that

$$P(x) \iff x \text{ encodes correct Ackermann computation tree}$$

- $\text{ack}(x, y) = z \iff \exists t \text{ such that } P(t) \text{ and } (t)_1 = \langle x, y, z \rangle$
- $\text{ack}(x, y) = ((\mu t) (P(t) \wedge (t)_{1,1} = x \wedge (t)_{1,2} = y))_{1,3}$
- Ackermann function is recursive

Definition

index $\ulcorner f \urcorner \in \mathbb{N}$ of derivation of primitive recursive function f is defined inductively:

- ▶ $\ulcorner z \urcorner = \langle 0 \rangle$
- ▶ $\ulcorner s \urcorner = \langle 1 \rangle$
- ▶ $\ulcorner \pi_i^n \urcorner = \langle 2, n, i \rangle$
- ▶ $\ulcorner f \urcorner = \langle 3, \ulcorner g \urcorner, \ulcorner h_1 \urcorner, \dots, \ulcorner h_m \urcorner \rangle$ if f is obtained by composing g and h_1, \dots, h_m
- ▶ $\ulcorner f \urcorner = \langle 4, \ulcorner g \urcorner, \ulcorner h \urcorner \rangle$ if f is obtained by primitive recursion from g and h

Part I: Recursive Function Theory

Ackermann function, bounded minimization, bounded recursion, course-of-values recursion, diagonalization, diophantine sets, elementary functions, fixed point theorem, Fibonacci numbers, Gödel numbering, Gödel's β function, Grzegorczyk hierarchy, loop programs, minimization, normal form theorem, partial recursive functions, primitive recursion, recursive enumerability, recursive inseparability, s-m-n theorem, total recursive functions, undecidability, while programs, ...

Part II: Combinatory Logic and Lambda Calculus

α -equivalence, abstraction, arithmetization, β -reduction, CL-representability, combinators, combinatorial completeness, Church numerals, Church–Rosser theorem, Curry–Howard isomorphism, de Bruijn notation, η -reduction, fixed point theorem, intuitionistic propositional logic, λ -definability, normalization theorem, termination, typing, undecidability, Z property, ...

Loop Programs

simple programming language

- ▶ natural numbers are only data type

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$ $x := y$

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$ $x := y$
 - ▶ increment $x++$

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$ $x := y$
 - ▶ increment $x++$
 - ▶ composition $P; Q$

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$ $x := y$
 - ▶ increment $x++$
 - ▶ composition $P; Q$
 - ▶ loop
 - ▶ **LOOP x DO P OD**

Loop Programs

simple programming language

- ▶ natural numbers are only data type
- ▶ variables x, y, z, \dots
- ▶ commands
 - ▶ assignment $x := 0$ $x := y$
 - ▶ increment $x++$
 - ▶ composition $P; Q$
 - ▶ loop
 - ▶ **LOOP x DO P OD**

execute P exactly n times, where n is value of x before entering loop

Examples

program P :

```
z := x;  
LOOP y DO  
    z++  
OD
```

Examples

program P :

```
z := x;  
LOOP y DO  
    z++  
OD
```

computes addition: $z = x + y$

Examples

program P :

```
z := x;  
LOOP y DO  
    z++  
OD
```

computes addition: $z = x + y$

notation: $P(x, y; z)$

Examples

program P :

```
z := x;  
LOOP y DO  
    z++  
OD
```

computes addition: $z = x + y$

notation: $P(x, y; z)$

multiplication $(x, y; z)$:

```
z := 0;  
LOOP x DO  
    LOOP y DO  
        z++  
    OD  
OD
```

Examples

program $P(x; y)$:

```
y := 0;  
z := 0;  
LOOP x DO  
    y := z;  
    z++  
OD
```

Examples

program $P(x; y)$:

```
y := 0;  
z := 0;  
LOOP x DO  
    y := z;  
    z++  
OD
```

computes predecessor: $y = p(x)$

Examples

program $P(x; y)$:

```
y := 0;  
z := 0;  
LOOP x DO  
    y := z;  
    z++  
OD
```

program $Q(x; y)$:

```
y := 0;  
z := 0;  
z++;  
LOOP x DO  
    y := z  
OD
```

computes predecessor: $y = p(x)$

Examples

program $P(x; y)$:

```
y := 0;  
z := 0;  
LOOP x DO  
    y := z;  
    z++  
OD
```

computes predecessor: $y = p(x)$

program $Q(x; y)$:

```
y := 0;  
z := 0;  
z++;  
LOOP x DO  
    y := z  
OD
```

computes sign function: $y = sg(x)$

LOOP programs **terminate**

Lemma

LOOP programs terminate

Definition

function $f: \mathbb{N}^n \rightarrow \mathbb{N}$ is **LOOP computable** if \exists LOOP program $P(x_1, \dots, x_n; y)$ such that

$$y = f(x_1, \dots, x_n)$$

after execution of P

Lemma

LOOP programs terminate

Definition

function $f: \mathbb{N}^n \rightarrow \mathbb{N}$ is LOOP computable if \exists LOOP program $P(x_1, \dots, x_n; y)$ such that

$$y = f(x_1, \dots, x_n)$$

after execution of P

Theorem

primitive recursive functions are LOOP computable

Proof

► zero

$$y = z(x) \quad y := 0$$

Proof

- ▶ zero $y = z(x)$ $y := 0$
- ▶ successor $y = s(x)$ $y := x; \; y++$

Proof

- ▶ zero $y = z(x)$ $y := 0$
- ▶ successor $y = s(x)$ $y := x; \; y++$
- ▶ projection $y = \pi_i^n(x_1, \dots, x_n)$ $y := x_i$

Proof

- ▶ zero $y = z(x)$ $y := 0$
- ▶ successor $y = s(x)$ $y := x; \; y++$
- ▶ projection $y = \pi_i^n(x_1, \dots, x_n)$ $y := x_i$
- ▶ composition $y = g(h_1(x_1, \dots, x_m), \dots, h_n(x_1, \dots, x_m))$

 $P_{h_1}(x_1, \dots, x_m; y_1); \dots; P_{h_n}(x_1, \dots, x_m; y_n); \; P_g(y_1, \dots, y_n; y)$

Proof

- ▶ zero $y = z(x)$ $y := 0$
- ▶ successor $y = s(x)$ $y := x; y++$
- ▶ projection $y = \pi_i^n(x_1, \dots, x_n)$ $y := x_i$
- ▶ composition $y = g(h_1(x_1, \dots, x_m), \dots, h_n(x_1, \dots, x_m))$
 $P_{h_1}(x_1, \dots, x_m; y_1); \dots; P_{h_n}(x_1, \dots, x_m; y_n); P_g(y_1, \dots, y_n; y)$
- ▶ primitive recursion $f(0, \vec{y}) = g(\vec{y})$ $P_g(y_1, \dots, y_n; z);$
 $f(x + 1, \vec{y}) = h(f(x, \vec{y}), x, \vec{y})$ $v := 0;$
LOOP x DO
 $P_h(z, v, y_1, \dots, y_n; w);$
 $z := w;$
 $v++$
 OD

Theorem

LOOP computable functions are primitive recursive

Theorem

LOOP computable functions are primitive recursive

Proof

- ▶ LOOP program P with variables x_1, \dots, x_n

Theorem

LOOP computable functions are primitive recursive

Proof

- ▶ LOOP program P with variables x_1, \dots, x_n
- ▶ claim: \exists primitive recursive functions $f_1, \dots, f_n: \mathbb{N}^n \rightarrow \mathbb{N}$ such that
 - if x_1, \dots, x_n have values a_1, \dots, a_n before execution of P
 - then x_i has value $f_i(a_1, \dots, a_n)$ after execution of P , for all $1 \leq i \leq n$

Theorem

LOOP computable functions are primitive recursive

Proof

- ▶ LOOP program P with variables x_1, \dots, x_n
- ▶ claim: \exists primitive recursive functions $f_1, \dots, f_n: \mathbb{N}^n \rightarrow \mathbb{N}$ such that
 - if x_1, \dots, x_n have values a_1, \dots, a_n before execution of P
 - then x_i has value $f_i(a_1, \dots, a_n)$ after execution of P , for all $1 \leq i \leq n$
- ▶ claim is proved by induction on structure of P (details left as exercise)

Theorem

LOOP computable functions are primitive recursive

Proof

- ▶ LOOP program P with variables x_1, \dots, x_n
- ▶ claim: \exists primitive recursive functions $f_1, \dots, f_n: \mathbb{N}^n \rightarrow \mathbb{N}$ such that
 - if x_1, \dots, x_n have values a_1, \dots, a_n before execution of P
 - then x_i has value $f_i(a_1, \dots, a_n)$ after execution of P , for all $1 \leq i \leq n$
- ▶ claim is proved by induction on structure of P (details left as exercise)

Example

$f_P(x, y) = f_3(x, y, 0, 0, 0)$ for LOOP program P with input variables x_1 and x_2 , output variable x_3 , and auxiliary variables x_4 and x_5

Definitions

- ▶ E_0 is smallest class of functions that contains all initial functions and is closed under composition and bounded recursion
- ▶ E_{n+1} is smallest class of functions that contains all initial functions, e_0, e_n and is closed under composition and bounded recursion

Examples

- ▶ E_0 contains $f(x) = x + 2$
- ▶ E_1 contains $f(x) = 4x$
- ▶ E_2 contains $f(x) = x^4$
- ▶ E_3 contains $f(x) = 2^{2^x}$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Proof

- $z(x) \leq x$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Proof

- ▶ $z(x) \leq x$
- ▶ $s(x) \leq x + 1$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Proof

- ▶ $z(x) \leq x$
- ▶ $s(x) \leq x + 1$
- ▶ $\pi_i^n(x_1, \dots, x_n) \leq x_i \leq \max \{x_1, \dots, x_n\}$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Proof

- ▶ $z(x) \leq x$
- ▶ $s(x) \leq x + 1$
- ▶ $\pi_i^n(x_1, \dots, x_n) \leq x_i \leq \max \{x_1, \dots, x_n\}$
- ▶ f is obtained by composing g and h_1, \dots, h_m

$$f(\vec{x}) = g(h_1(\vec{x}), \dots, h_m(\vec{x}))$$

Lemma

$\forall f: \mathbb{N}^n \rightarrow \mathbb{N} \in E_0 \quad \exists c \in \mathbb{N} \quad \text{such that} \quad f(x_1, \dots, x_n) \leq \max \{x_1, \dots, x_n\} + c$

Proof

$e_n \in E_{n+1} \setminus E_n$

Lemma

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

- $e_0(x, y) = x + y \implies \neg \exists c \in \mathbb{N} \text{ with } x + y \leq \max\{x, y\} + c$

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

- ▶ $e_0(x, y) = x + y \implies \neg \exists c \in \mathbb{N} \text{ with } x + y \leq \max\{x, y\} + c$
- ▶ $e_1(x) = x^2 + 2 \implies \neg \exists a, b \in \mathbb{N} \text{ with } x^2 + 2 \leq ax + b$

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

- ▶ $e_0(x, y) = x + y \implies \neg \exists c \in \mathbb{N} \text{ with } x + y \leq \max\{x, y\} + c$
- ▶ $e_1(x) = x^2 + 2 \implies \neg \exists a, b \in \mathbb{N} \text{ with } x^2 + 2 \leq ax + b$
- ▶ $e_{n+2} \in E_{n+2} \implies e_{n+2}(e_0(x, x)) \in E_{n+2}$

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

- ▶ $e_0(x, y) = x + y \implies \neg \exists c \in \mathbb{N} \text{ with } x + y \leq \max\{x, y\} + c$
- ▶ $e_1(x) = x^2 + 2 \implies \neg \exists a, b \in \mathbb{N} \text{ with } x^2 + 2 \leq ax + b$
- ▶ $e_{n+2} \in E_{n+2} \implies e_{n+2}(e_0(x, x)) \in E_{n+2}$ and thus

$$e_{n+2}(x + x) \leq e_{n+2}(k + x)$$

for some $k \in \mathbb{N}$

$$e_n \in E_{n+1} \setminus E_n$$

Proof

$e_n \notin E_n$ by case analysis on n

- ▶ $e_0(x, y) = x + y \implies \neg \exists c \in \mathbb{N} \text{ with } x + y \leq \max\{x, y\} + c$
- ▶ $e_1(x) = x^2 + 2 \implies \neg \exists a, b \in \mathbb{N} \text{ with } x^2 + 2 \leq ax + b$
- ▶ $e_{n+2} \in E_{n+2} \implies e_{n+2}(e_0(x, x)) \in E_{n+2}$ and thus

$$e_{n+2}(x + x) \leq e_{n+2}(k + x)$$

for some $k \in \mathbb{N}$

Theorem (Grzegorczyk Hierarchy)

- 1 $E_0 \subsetneq E_1 \subsetneq E_2 \subsetneq \dots$

Theorem (Grzegorczyk Hierarchy)
