- 4. CL-Representability**
- 5. Summary**

## Definition (Parallel Reduction)

- ▶  $t \twoheadrightarrow t$  for all  $t \in \{\mathbf{S}, \mathbf{K}, \mathbf{I}\} \cup \mathcal{V}$
- ▶  $\mathbf{I}t \twoheadrightarrow t$   $\mathbf{K}tu \twoheadrightarrow t$   $\mathbf{S}tuv \twoheadrightarrow tv(uv)$  for all CL-terms  $t, u, v$
- ▶  $t_1 t_2 \twoheadrightarrow u_1 u_2$  if  $t_1 \twoheadrightarrow u_1$  and  $t_2 \twoheadrightarrow u_2$  for all CL-terms  $t_1, t_2, u_1, u_2$

## Lemmata

- ▶  $\rightarrow \subseteq \twoheadrightarrow \subseteq \rightarrow^*$
- ▶  $\twoheadrightarrow$  has diamond property

## Corollary

CL is confluent

## Definition

ARS  $\mathcal{A} = \langle A, \rightarrow \rangle$  has **Z property** if

$$a \rightarrow b \implies b \rightarrow^* \bullet(a) \rightarrow^* \bullet(b)$$

for some function  $\bullet$  on  $A$

## Lemma (Monotonicity)

$a \rightarrow^* b \implies a^\bullet \rightarrow^* b^\bullet$  for every ARS  $\langle A, \rightarrow \rangle$  with Z property for  $\bullet$

## Definition

functions  $\diamond$  and  $\star$  on CL-terms:

$$t^\diamond = \begin{cases} u^\diamond \star v^\diamond & \text{if } t = uv \\ t & \text{otherwise} \end{cases}$$

$$s \star t = \begin{cases} ut(vt) & \text{if } s = \mathbf{S}uv \\ u & \text{if } s = \mathbf{K}u \\ t & \text{if } s = \mathbf{I} \\ st & \text{otherwise} \end{cases}$$

## Lemma

every ARS with Z property is confluent

## Theorem

CL has Z property for  $\diamond$

## Definition

**recursion combinator** is combinator  $R$  such that

$$R x y \underline{0} \leftrightarrow^* x \qquad R x y \underline{n+1} \leftrightarrow^* y \underline{n} (R x y \underline{n})$$

## Lemma

if  $R$  is recursion combinator then

$$F = \langle z y_1 \dots y_n \rangle (R (G y_1 \dots y_n) \langle u v \rangle (H v u y_1 \dots y_n) z)$$

represents primitive recursive function  $f$  based on  $g$  and  $h$

## Definitions

$D = \langle xyz \rangle (z (K y) x) = C(BC(B(CI)K))$  (pairing combinator)

$Q = \langle xy \rangle (D (\text{succ } y \underline{0}) (x (y \underline{0}) (y \underline{1})))$

$R = \langle xyz \rangle (z (Q y) (D \underline{0} x) \underline{1})$

## Lemmata

- ▶  $D x y \underline{0} \rightarrow^+ x$
- ▶  $D x y \underline{n} \rightarrow^+ y$  for all  $n > 0$
- ▶  $Q x (D \underline{n} y) \rightarrow^+ D \underline{n+1} (x \underline{n} y)$
- ▶  $R$  is recursion combinator

## Lemma

CL-representable functions are closed under minimization

## Part I: Recursive Function Theory

Ackermann function, bounded minimization, bounded recursion, course-of-values recursion, diagonalization, diophantine sets, elementary functions, fixed point theorem, Fibonacci numbers, Gödel numbering, Gödel's  $\beta$  function, Grzegorzcyk hierarchy, loop programs, minimization, normal form theorem, partial recursive functions, primitive recursion, recursive enumerability, recursive inseparability, s-m-n theorem, total recursive functions, undecidability, while programs, ...

## Part II: Combinatory Logic and Lambda Calculus

$\alpha$ -equivalence, abstraction, arithmetization,  $\beta$ -reduction, **CL-representability**, combinators, combinatorial completeness, Church numerals, Church-Rosser theorem, Curry-Howard isomorphism, de Bruijn notation,  $\eta$ -reduction, fixed point theorem, intuitionistic propositional logic,  $\lambda$ -definability, **normalization theorem**, termination, typing, undecidability, Z property, ...

# Outline

1. Summary of Previous Lecture
- 2. Strategies**
3. Normalization Theorem
4. CL-Representability
5. Summary

## Definitions

- ▶ (**many-step**) **strategy**  $\mathcal{S}$  for ARS  $\mathcal{A} = \langle A, \rightarrow \rangle$  is relation  $\rightarrow_{\mathcal{S}}$  such that
  - ①  $\rightarrow_{\mathcal{S}} \subseteq \rightarrow^+$
  - ②  $\text{NF}(\rightarrow_{\mathcal{S}}) = \text{NF}(\mathcal{A})$
- ▶ **one-step** strategy satisfies  $\rightarrow_{\mathcal{S}} \subseteq \rightarrow$
- ▶ strategy  $\mathcal{S}$  is **deterministic** if  $a = b$  whenever  $a \mathcal{S} \leftarrow \cdot \rightarrow_{\mathcal{S}} b$
- ▶ strategy  $\mathcal{S}$  for ARS  $\mathcal{A}$  is **normalizing** if every normalizing element is  $\mathcal{S}$ -terminating
- ▶ strategy  $\mathcal{S}$  for ARS  $\mathcal{A}$  is **hyper-normalizing** if every normalizing element is terminating with respect to  $\rightarrow^* \cdot \rightarrow_{\mathcal{S}} \cdot \rightarrow^*$

## Lemma

hyper-normalization  $\implies$  normalization

## Definition

strategy  $\mathcal{S}_\bullet$  for ARS  $\mathcal{A}$  with Z property for  $\bullet$ :  $a \dashrightarrow b$  if  $a \notin \text{NF}(\mathcal{A})$  and  $b = a^\bullet$

## Theorem

$\mathcal{S}_\bullet$  is normalizing for every ARS with Z property for  $\bullet$

## Proof

①  $a \rightarrow^n b$  and  $n > 0 \implies b \rightarrow^* \bullet^n(a)$  by induction on  $n$ :

$a \rightarrow c \rightarrow^{n-1} b \implies c \rightarrow^* \bullet(a)$  (Z property)

▶  $n = 1 \implies b = c$

▶  $n > 1 \implies b \rightarrow^* \bullet^{n-1}(c)$  (induction hypothesis)

$\bullet^{n-1}(c) \rightarrow^* \bullet^n(a) \implies b \rightarrow^* \bullet^n(a)$  ( $n - 1$  applications of monotonicity)

## Theorem

$\mathcal{S}_\bullet$  is normalizing strategy for every ARS with Z property for  $\bullet$

## Proof (cont'd)

$$\textcircled{1} \quad a \rightarrow^n b \text{ and } n > 0 \quad \Longrightarrow \quad b \rightarrow^* \bullet^n(a)$$

$$\textcircled{2} \quad a \rightarrow^{\leq n} \bullet^n(a) \text{ for all } n \geq 0 \quad \text{by induction on } n$$

$$\blacktriangleright \quad n = 0 \quad \Longrightarrow \quad a = \bullet^n(a)$$

$$\blacktriangleright \quad n > 0 \quad \Longrightarrow \quad a \rightarrow^{\leq n-1} \bullet^{n-1}(a) \rightarrow^{\bullet} = \bullet^{n-1}(a)^\bullet = \bullet^n(a) \quad (\text{induction hypothesis})$$

$$\textcircled{3} \quad a \rightarrow^n b \text{ with } n > 0 \text{ and } b \in \text{NF}(\rightarrow)$$

$$a \rightarrow^{\leq n} \bullet^n(a) \bullet^{\leftarrow} b \quad \Longrightarrow \quad a \rightarrow^{\leq n} b \quad \Longrightarrow \quad \mathcal{S}_\bullet \text{ is normalizing}$$

## Theorem

$\mathcal{S}_\bullet$  is hyper-normalizing strategy for every ARS with Z property for  $\bullet$

## Theorem

$\mathcal{S}_\bullet$  is hyper-normalizing strategy for every ARS with Z property for  $\bullet$

## Proof (sketch)

①  $\rightarrow^* \cdot \rightarrow \subseteq \rightarrow \cdot \rightarrow^*$

▶ suppose  $a \rightarrow^* b \rightarrow c$

▶  $b \notin \text{NF} \implies a \notin \text{NF} \implies a \rightarrow \bullet(a) \rightarrow^* \bullet(b) = c$  (monotonicity)

②  $\mathcal{S}_\bullet$  is normalizing strategy  $\implies \mathcal{S}_\bullet$  is hyper-normalizing strategy

# Outline

1. Summary of Previous Lecture
2. Strategies
- 3. Normalization Theorem**
4. CL-Representability
5. Summary

## Definition

▶ **root reduction**  $\xrightarrow{\epsilon}$ :  $I t \xrightarrow{\epsilon} t$     $K t u \xrightarrow{\epsilon} t$     $S t u v \xrightarrow{\epsilon} t v (u v)$

▶ **leftmost outermost reduction**  $\xrightarrow{lo}$ :

$$\frac{t \xrightarrow{\epsilon} u}{t \xrightarrow{lo} u} \quad \frac{t \xrightarrow{lo} u \quad t v \in \text{NF}(\xrightarrow{\epsilon})}{t v \xrightarrow{lo} u v}$$

$$\frac{t \xrightarrow{lo} u \quad v t \in \text{NF}(\xrightarrow{\epsilon}) \quad v \in \text{NF}(\rightarrow)}{v t \xrightarrow{lo} v u}$$

for all CL-terms  $t, u, v$

## Example

$$\overline{KI(IS) \xrightarrow{\epsilon} I}$$

$$\overline{KI(IS) \xrightarrow{lo} I} \quad \overline{KI(IS)I \in \text{NF}(\xrightarrow{\epsilon})}$$

$$\overline{KI(IS)I \xrightarrow{lo} II}$$

$$\overline{K(KI(IS)I) \in \text{NF}(\xrightarrow{\epsilon})}$$

$$\overline{K \in \text{NF}(\rightarrow)}$$

$$\overline{K(KI(IS)I) \xrightarrow{lo} K(II)}$$

## Definition

$t \xrightarrow{\neg lo} u$  if  $t \rightarrow u$  but not  $t \xrightarrow{lo} u$

## Example

$$\begin{array}{l} SSSSSSSS \xrightarrow{lo} SS(SS)SSSS \xrightarrow{lo} SS(SSS)SSS \xrightarrow{lo} SS(SSSS)SS \\ \xrightarrow{\neg lo} SS(SS(SS))SS \xrightarrow{lo} SS(SS(SS)S)S \xrightarrow{\neg lo} SS(SS(SSS))S \\ \xrightarrow{lo} SS(SS(SSS)S) \xrightarrow{lo} SS(SS(SSSS)) \xrightarrow{lo} SS(SS(SS(SS))) \end{array}$$

## Theorem (Factorization)

$$\rightarrow^* \subseteq \xrightarrow{lo}^* \cdot \xrightarrow{\neg lo}^*$$

## Theorem

leftmost outermost reduction is **normalizing**

## Proof

- ▶ assume  $t \rightarrow^! u \implies t \xrightarrow{\text{lo}}^* \cdot \xrightarrow{\neg\text{lo}}^* u$  by factorization
- ▶  $u$  is normal form  $\implies v \xrightarrow{\neg\text{lo}} u$  is impossible  $\implies t \xrightarrow{\text{lo}}^* u$

## Theorem

leftmost outermost reduction is **hyper-normalizing**

## Proof

infinite reduction

$$t \xrightarrow{\neg\text{lo}}^* \cdot \xrightarrow{\text{lo}} \cdot \xrightarrow{\neg\text{lo}}^* \cdot \xrightarrow{\text{lo}} \cdot \xrightarrow{\neg\text{lo}}^* \dots$$

gives rise to infinite  $\xrightarrow{\text{lo}}$  reduction starting from  $t$  by **factorization**

## Example

combinator  $SII(SII)$  is not **normalizing**:

$$SII(SII) \xrightarrow{lo} I(SII)(I(SII)) \xrightarrow{lo} SII(I(SII)) \longrightarrow SII(SII)$$

# Outline

5. Summary

## Definition

$$T = \langle x \rangle (D \underline{0} (\langle uv \rangle (u (x (\text{succ } v)) u (\text{succ } v)))) \quad P = \langle xy \rangle (T x (x y) (T x) y)$$

## Lemma

$$P x y \leftrightarrow^* \begin{cases} y & \text{if } x y \rightarrow^* \underline{0} \\ P x (\text{succ } y) & \text{if } x y \rightarrow^* \underline{n+1} \end{cases}$$

## Proof

- ▶  $P x y \rightarrow^* D \underline{0} (\langle uv \rangle (u (x (\text{succ } v)) u (\text{succ } v))) (x y) (T x) y$
- ▶  $x y \rightarrow^* \underline{0} \implies P x y \rightarrow^* \underline{0} (T x) y \rightarrow^* y$
- ▶  $x y \rightarrow^* \underline{n+1} \implies P x y \rightarrow^* (\langle uv \rangle (u (x (\text{succ } v)) u (\text{succ } v))) (T x) y$   
 $\rightarrow^* T x (x (\text{succ } y)) (T x) (\text{succ } y) \leftrightarrow^* P x (\text{succ } y)$

## Theorem

partial recursive functions are CL-representable by combinators in normal form

## Proof

partial recursive function  $\varphi(x_1, \dots, x_n) \simeq u((\mu i) (g(x_1, \dots, x_n, i) = 0))$

with primitive recursive functions  $u$  and  $g$  that are represented by combinators  $U$  and  $G$

- ▶  $F_1 = \langle x_1 \cdots x_n \rangle (U (P (G x_1 \cdots x_n) \underline{0}))$
- ▶  $F_2 = \langle x_1 \cdots x_n \rangle (P (G x_1 \cdots x_n) \underline{0} \mid (F_1 x_1 \cdots x_n))$  represents  $\varphi$
- ▶  $A = G \underline{x_1} \cdots \underline{x_n}$  and  $B = F_1 \underline{x_1} \cdots \underline{x_n}$
- ▶ case 1:  $\varphi(x_1, \dots, x_n) \downarrow$

$\varphi(x_1, \dots, x_n) = u(y)$  for  $y = (\mu i) (g(x_1, \dots, x_n, i) = 0)$

$$\begin{aligned} F_2 \underline{x_1} \cdots \underline{x_n} &\rightarrow^* P A \underline{0} \mid B \leftrightarrow^* P A \underline{y} \mid B \leftrightarrow^* \underline{y} \mid B \rightarrow^* \mid^y B \rightarrow^* B \\ &\rightarrow^* U (P A \underline{0}) \leftrightarrow^* U \underline{y} \rightarrow^* \underline{u(y)} = \underline{\varphi(x_1, \dots, x_n)} \end{aligned}$$

## Proof (cont'd)

partial recursive function  $\varphi(x_1, \dots, x_n) \simeq u((\mu i)(g(x_1, \dots, x_n, i) = 0))$

with primitive recursive functions  $u$  and  $g$  that are represented by  $U$  and  $G$

- ▶  $F_1 = \langle x_1 \cdots x_n \rangle (U (P (G x_1 \cdots x_n) \underline{0}))$
- ▶  $F_2 = \langle x_1 \cdots x_n \rangle (P (G x_1 \cdots x_n) \underline{0} \mid (F_1 x_1 \cdots x_n))$  represents  $\varphi$
- ▶  $A = G \underline{x_1} \cdots \underline{x_n}$  and  $B = F_1 \underline{x_1} \cdots \underline{x_n}$
- ▶ case 2:  $\varphi(x_1, \dots, x_n) \uparrow$

$$\begin{aligned} F_2 \underline{x_1} \cdots \underline{x_n} &\rightarrow^* P A \underline{0} \mid B \rightarrow^* T A (A \underline{0}) (T A) \underline{0} \mid B \rightarrow^* T A \underline{m+1} (T A) \underline{0} \mid B \\ &\rightarrow^* D \underline{0} (\langle uv \rangle (u (A (\text{succ } v)) u (\text{succ } v))) \underline{m+1} (T A) \underline{0} \mid B \\ &\rightarrow^* \langle uv \rangle (u (A (\text{succ } v)) u (\text{succ } v)) (T A) \underline{0} \mid B \\ &\rightarrow^* T A (A (\text{succ } \underline{0})) (T A) (\text{succ } \underline{0}) \mid B \\ &\rightarrow^* T A (A \underline{1}) (T A) \underline{1} \mid B \rightarrow^* \dots \rightarrow^* T A (A \underline{2}) (T A) \underline{2} \mid B \rightarrow^* \dots \end{aligned}$$

contains  $\xrightarrow{\text{lo}}$  step  $\implies F_2 \underline{x_1} \cdots \underline{x_n}$  has no normal form by hyper-normalization of  $\xrightarrow{\text{lo}}$
