

Computability Theory

Aart Middeldorp

Definitions

- ▶ **Gödel number** of CL-term is defined inductively:

$$g(\mathbf{I}) = \langle 0 \rangle \quad g(\mathbf{K}) = \langle 1 \rangle \quad g(\mathbf{S}) = \langle 2 \rangle \quad g(tu) = \langle 3, g(t), g(u) \rangle \quad g(x_i) = \langle 4, i \rangle$$

- ▶ $\text{enc}(n) = g(\underline{n})$
- ▶ sets T and U of CL-terms are **recursively separable** if $\{g(t) \mid t \in T\}$ and $\{g(u) \mid u \in U\}$ are recursively separable
- ▶ set T of CL-terms is **conversion-closed** if $u \in T$ whenever $t \in T$ and $t \leftrightarrow^* u$

Theorem

CL-representable functions are **partial recursive**

Notation

$\ulcorner t \urcorner = g(\underline{t})$ is Church numeral of Gödel number of CL-term t

Outline

7. Test

Theorem

\forall CL-term $F \exists$ CL-term X such that $F \ulcorner X \urcorner \leftrightarrow^* X$

Theorem

- ▶ non-empty conversion-closed sets of CL-terms are recursively inseparable
- ▶ non-trivial conversion-closed sets of CL-terms are not recursive

Corollary

set of normalizing CL-terms is not recursive: decision problem

instance: CL-term t

question: is t normalizing ?

is undecidable

Definition (Types)

set \mathbb{T} of **types** is defined inductively:

- ▶ $\forall \subseteq \mathbb{T}$ infinite set of **type variables**
- ▶ $\mathbb{C} \subseteq \mathbb{T}$ **type constants**
- ▶ if $\sigma, \tau \in \mathbb{T}$ then $(\sigma \rightarrow \tau) \in \mathbb{T}$

Definition (Type Assignment, Curry-style)

- ▶ type assignment formula $t : \tau$ with CL-term t and type τ
- ▶ type assignment system **TA**

$$\frac{}{I : \sigma \rightarrow \sigma} \quad \frac{}{K : \sigma \rightarrow \tau \rightarrow \sigma} \quad \frac{}{S : (\rho \rightarrow \sigma \rightarrow \tau) \rightarrow (\rho \rightarrow \sigma) \rightarrow \rho \rightarrow \tau}$$
$$\frac{t : \sigma \rightarrow \tau \quad u : \sigma}{tu : \tau}$$

for all types σ, τ, ρ and CL-terms s and t

Notation

$\Gamma \vdash t : \tau$ if $t : \tau$ can be derived in TA from assumptions in Γ

Theorem

if $\Gamma, x : \sigma \vdash t : \tau$ and $x \notin \text{Var}(\Gamma)$ then $\Gamma \vdash [x]t : \sigma \rightarrow \tau$

Theorem (Subject Reduction)

if $\Gamma \vdash t : \tau$ and $t \rightarrow u$ then $\Gamma \vdash u : \tau$

Definition

CL-term t with $\text{Var}(t) = \{x_1, \dots, x_n\}$ is **typable** if

$$x_1 : \rho_1, \dots, x_n : \rho_n \vdash t : \tau$$

for some types $\rho_1, \dots, \rho_n, \tau$

Part I: Recursive Function Theory

Ackermann function, bounded minimization, bounded recursion, course-of-values recursion, diagonalization, diophantine sets, elementary functions, fixed point theorem, Fibonacci numbers, Godel numbering, Godel's β function, Grzegorzcyk hierarchy, loop programs, minimization, normal form theorem, partial recursive functions, primitive recursion, recursive enumerability, recursive inseparability, s - m - n theorem, total recursive functions, undecidability, while programs, ...

Part II: Combinatory Logic and Lambda Calculus

α -equivalence, abstraction, arithmetization, β -reduction, CL-representability, combinators, combinatorial completeness, Church numerals, Church-Rosser theorem, Curry-Howard isomorphism, de Bruijn notation, η -reduction, fixed point theorem, **intuitionistic propositional logic**, λ -definability, normalization theorem, **termination**, **typing**, undecidability, Z property, ...

Outline

1. Summary of Previous Lecture
2. Strong Normalization
3. Type Inference
4. Type Inhabitation
5. Intuitionistic Propositional Logic
6. Summary
7. Test

Theorem (Strong Normalization)

typable CL-terms are terminating (SN)

Definition

typable CL-term t is **strongly computable (SC)** if

- ▶ t has atomic type $\tau \in \mathbb{V} \cup \mathbb{C}$ and is SN
- ▶ t has type $\sigma \rightarrow \tau$ and tu is SC whenever $u : \sigma$ is SC

Lemma 1

for any type τ

- 1 every term $xu_1 \cdots u_n$ of type τ with variable x and SN terms u_1, \dots, u_n is SC
- 2 every SC term of type τ is SN

Proof

induction on τ

▶ base case: τ is atomic

- 1 $t = xu_1 \cdots u_n$ is SN $\implies t$ is SC
- 2 $t : \tau$ is SC $\implies t$ is SN

▶ step case: $\tau = \rho \rightarrow \sigma$

- 1 $v : \rho$ is SC $\implies v$ is SN $\implies xu_1 \cdots u_n v : \sigma$ is SC $\implies xu_1 \cdots u_n : \tau$ is SC
- 2 consider SC term $t : \tau$ and $x : \rho$ with $x \in \mathcal{V} \setminus \text{Var}(t)$
 $\implies x$ is SC $\implies tx$ is SC $\implies tx$ is SN $\implies t$ is SN

Lemma 2

S, K and I are SC

Proof

K: $\sigma \rightarrow \tau \rightarrow \sigma$

- ▶ $\sigma = \sigma_1 \rightarrow \cdots \rightarrow \sigma_n \rightarrow \theta$ with atomic type θ and $n \geq 0$
- ▶ consider arbitrary SC terms $s : \sigma \quad t : \tau \quad u_1 : \sigma_1 \quad \dots \quad u_n : \sigma_n$
- ▶ s is SC $\implies su_1 \cdots u_n$ is SC $\implies stu_1 \cdots u_n$ is SN
- ▶ t is SC $\implies t$ is SN
- ▶ **K** $stu_1 \cdots u_n$ is SN: any infinite reduction starts with

$$\begin{aligned} \text{K}stu_1 \dots u_n &\rightarrow^* \text{K}s't'u'_1 \dots u'_n \rightarrow s'u'_1 \dots u'_n \rightarrow^* \dots \\ &\implies su_1 \dots u_n \rightarrow s'u'_1 \dots u'_n \rightarrow^* \dots \end{aligned}$$

with $s \rightarrow^* s' \quad t \rightarrow^* t' \quad u_1 \rightarrow^* u'_1 \quad u_n \rightarrow^* u'_n$

S and **I**: homework exercise

Lemma

every typable CL-term is SC

Proof

induction on term t

- ▶ t is variable $\implies t$ is SC by lemma 1
- ▶ $t \in \{\mathbf{I}, \mathbf{K}, \mathbf{S}\}$ $\implies t$ is SC by lemma 2
- ▶ $t = t_1 t_2 \implies t_1$ and t_2 are SC by induction hypothesis $\implies t$ is SC

Corollary

typable CL-terms are SN

Outline

1. Summary of Previous Lecture
2. Strong Normalization

4. Type Inhabitation
5. Intuitionistic Propositional Logic
6. Summary
7. Test

Theorem

problem

instance: CL-term t
 question: is t typable?

is decidable

Definition

principal type of combinator t is any type σ such that

- ① $\vdash t : \sigma$
- ② if $\vdash t : \tau$ then τ is substitution instance of σ

Example

SKK has principal type $a \rightarrow a$ (where a is type variable)

Theorem

every typable combinator has principal type

Type Inference

principle types can be computed by typing rules of TA (with type variables σ, τ, ρ)

$$\overline{I : \sigma \rightarrow \sigma} \quad \overline{K : \sigma \rightarrow \tau \rightarrow \sigma} \quad \overline{S : (\rho \rightarrow \sigma \rightarrow \tau) \rightarrow (\rho \rightarrow \sigma) \rightarrow \rho \rightarrow \tau}$$

$$\frac{t : \sigma \rightarrow \tau \quad u : \sigma}{tu : \tau}$$

and unification algorithm

Example ①

principle type of **SKK** : $\sigma_1 \rightarrow \sigma_1$

► **SK** : $\alpha \rightarrow \beta$ **K** : α

► **S** : $\gamma \rightarrow \delta$ **K** : γ

► unification problem

$$\begin{array}{lll} \alpha \approx \sigma_1 \rightarrow \tau_1 \rightarrow \sigma_1 & \delta \approx \alpha \rightarrow \beta & \gamma \rightarrow \delta \approx (\rho_2 \rightarrow \sigma_2 \rightarrow \tau_2) \rightarrow (\rho_2 \rightarrow \sigma_2) \rightarrow \rho_2 \rightarrow \tau_2 \\ \gamma \approx \sigma_3 \rightarrow \tau_3 \rightarrow \sigma_3 & \gamma \approx \rho_2 \rightarrow \sigma_2 \rightarrow \tau_2 & \delta \approx (\rho_2 \rightarrow \sigma_2) \rightarrow \rho_2 \rightarrow \tau_2 \\ \alpha \approx \rho_2 \rightarrow \sigma_2 & \beta \approx \rho_2 \rightarrow \tau_2 & \rho_2 \approx \sigma_1 \quad \sigma_2 \approx \tau_1 \rightarrow \sigma_1 \approx \tau_3 \\ \sigma_3 \approx \rho_2 \approx \sigma_1 \approx \tau_2 & \tau_3 \approx \sigma_2 & \sigma_3 \approx \tau_2 \end{array}$$

► mgu

$$\left\{ \begin{array}{ll} \alpha \mapsto \sigma_1 \rightarrow \tau_1 \rightarrow \sigma_1 & \gamma \mapsto \sigma_1 \rightarrow (\tau_1 \rightarrow \sigma_1) \rightarrow \sigma_1 \\ \beta \mapsto \sigma_1 \rightarrow \sigma_1 & \delta \mapsto (\sigma_1 \rightarrow \tau_1 \rightarrow \sigma_1) \rightarrow \sigma_1 \rightarrow \sigma_1 \end{array} \right\}$$

Example 2

SII cannot be typed

▶ $S I : \alpha \rightarrow \beta \quad I : \alpha$

▶ $S : \gamma \rightarrow \delta \quad I : \gamma$

▶ unification problem

$$\alpha \approx \sigma_1 \rightarrow \sigma_1 \quad \delta \approx \alpha \rightarrow \beta \quad \gamma \rightarrow \delta \approx (\rho_2 \rightarrow \sigma_2 \rightarrow \tau_2) \rightarrow (\rho_2 \rightarrow \sigma_2) \rightarrow \rho_2 \rightarrow \tau_2$$

$$\gamma \approx \sigma_3 \rightarrow \sigma_3 \quad \gamma \approx \rho_2 \rightarrow \sigma_2 \rightarrow \tau_2 \quad \delta \approx (\rho_2 \rightarrow \sigma_2) \rightarrow \rho_2 \rightarrow \tau_2$$

$$\sigma_3 \approx \rho_2 \approx \sigma_2 \rightarrow \tau_2 \approx \sigma_1 \approx \sigma_2$$

$$\alpha \approx \rho_2 \rightarrow \sigma_2 \quad \beta \approx \rho_2 \rightarrow \tau_2 \quad \sigma_1 \approx \rho_2 \approx \sigma_2$$

has no solution

Example 3

principle type of $B = S(KS)K : (\sigma_4 \rightarrow \tau_4) \rightarrow (\rho_4 \rightarrow \sigma_4) \rightarrow \rho_4 \rightarrow \tau_4$

▶ $S(KS) : \alpha \rightarrow \beta \quad K : \alpha$

▶ $S : \gamma \rightarrow \delta \quad KS : \gamma$

▶ $K : \epsilon \rightarrow \eta \quad S : \epsilon$

▶ unification problem

$$\alpha \approx \sigma_1 \rightarrow \tau_1 \rightarrow \sigma_1 \quad \delta \approx \alpha \rightarrow \beta \quad \gamma \rightarrow \delta \approx (\rho_2 \rightarrow \sigma_2 \rightarrow \tau_2) \rightarrow (\rho_2 \rightarrow \sigma_2) \rightarrow \rho_2 \rightarrow \tau_2$$

$$\gamma \approx \eta \quad \epsilon \rightarrow \eta \approx \sigma_3 \rightarrow \tau_3 \rightarrow \sigma_3 \quad \epsilon \approx (\rho_4 \rightarrow \sigma_4 \rightarrow \tau_4) \rightarrow (\rho_4 \rightarrow \sigma_4) \rightarrow \rho_4 \rightarrow \tau_4$$

▶ mgu

$$\{ \beta \mapsto (\sigma_4 \rightarrow \tau_4) \rightarrow (\rho_4 \rightarrow \sigma_4) \rightarrow \rho_4 \rightarrow \tau_4 \quad \dots \}$$

Outline

1. Summary of Previous Lecture
2. Strong Normalization
3. Type Inference
- 4. Type Inhabitation**
5. Intuitionistic Propositional Logic
6. Summary
7. Test

Definition

type τ is **inhabited** if $\vdash t : \tau$ for some combinator t

Remark

not every type is inhabited

Theorem

problem

instance: type τ

question: is τ inhabited?

is decidable

Remark

$I : \sigma \rightarrow \sigma$ $K : \sigma \rightarrow \tau \rightarrow \sigma$ $S : (\rho \rightarrow \sigma \rightarrow \tau) \rightarrow (\rho \rightarrow \sigma) \rightarrow \rho \rightarrow \tau$

valid formulas in **intuitionistic** propositional logic

Theorem (Curry–Howard)

type τ (without type constants) is inhabited if and only if τ is valid formula in implication fragment of intuitionistic propositional logic

Syntax

- ▶ basic connectives $\rightarrow \wedge \vee \perp$
- ▶ derived connectives
 - ▶ $\neg\varphi$ abbreviates $\varphi \rightarrow \perp$
 - ▶ \top abbreviates $\perp \rightarrow \perp$
 - ▶ $\varphi \leftrightarrow \psi$ abbreviates $(\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)$
- ▶ **implication fragment** contains only \rightarrow

Formal Semantics

- ▶ Heyting algebras
- ▶ **Kripke models**

Outline

1. Summary of Previous Lecture
2. Strong Normalization
3. Type Inference
4. Type Inhabitation
5. Intuitionistic Propositional Logic
 - Kripke models
6. Summary
7. Test

Definition

Kripke model is triple $\mathcal{C} = \langle C, \leq, \Vdash \rangle$ with

- ▶ non-empty set C of states
- ▶ partial order \leq on C
- ▶ binary relation \Vdash between elements of C and propositional atoms such that $d \Vdash p$ whenever $c \Vdash p$ and $c \leq d$

Definition

Kripke model $\mathcal{C} = \langle C, \leq, \Vdash \rangle$, $c \in C$

- ▶ $c \Vdash \varphi \wedge \psi$ if and only if $c \Vdash \varphi$ and $c \Vdash \psi$
- ▶ $c \Vdash \varphi \vee \psi$ if and only if $c \Vdash \varphi$ or $c \Vdash \psi$
- ▶ $c \Vdash \varphi \rightarrow \psi$ if and only if $d \Vdash \psi$ for all $d \geq c$ with $d \Vdash \varphi$
- ▶ $c \not\Vdash \perp$

Terminology

c **forces** p if $c \Vdash p$

Example

Kripke model $\mathcal{C} = \langle C, \leq, \Vdash \rangle$ with $C = \{a, b, c\}$, $a \leq b$, $a \leq c$, $b \Vdash p$, $c \Vdash q$

- ▶ $a \Vdash (p \rightarrow q) \rightarrow q$
- ▶ $a \Vdash \neg\neg(p \vee q)$
- ▶ $a \not\Vdash p \vee \neg p$

Definition

Kripke model $\mathcal{C} = \langle C, \leq, \Vdash \rangle$, $c \in C$

- ▶ $c \Vdash \Gamma$ if $c \Vdash \varphi$ for all $\varphi \in \Gamma$
- ▶ $\mathcal{C} \Vdash \varphi$ if $c \Vdash \varphi$ for all $c \in C$

Definition

$\Gamma \Vdash \varphi$ if $c \Vdash \varphi$ whenever $c \Vdash \Gamma$ for all Kripke models $\mathcal{C} = \langle C, \leq, \Vdash \rangle$ and $c \in C$

Lemma (Monotonicity)

if $c \leq d$ and $c \Vdash \varphi$ then $d \Vdash \varphi$

Lemma

if $\Vdash \varphi \vee \psi$ then $\Vdash \varphi$ or $\Vdash \psi$
