

# Automata and Logic

Aart Middeldorp and Johannes Niederhauser

## Definitions

- regular expression  $\alpha$  over alphabet  $\Sigma$ :

$$a \in \Sigma \quad \epsilon \quad \emptyset \quad \beta + \gamma \quad \beta\gamma \quad \beta^*$$

- set of strings  $L(\alpha) \subseteq \Sigma^*$  matched by regular expression  $\alpha$ :

$$\begin{array}{lll} L(a) = \{a\} & L(\emptyset) = \emptyset & L(\beta\gamma) = L(\beta)L(\gamma) \\ L(\epsilon) = \{\epsilon\} & L(\beta + \gamma) = L(\beta) \cup L(\gamma) & L(\beta^*) = L(\beta)^* \end{array}$$

- regular expressions  $\alpha$  and  $\beta$  are equivalent ( $\alpha \equiv \beta$ ) if  $L(\alpha) = L(\beta)$

## Theorem

finite automata and regular expressions are equivalent:

$$\text{for all } A \subseteq \Sigma^* \quad A \text{ is regular} \iff A = L(\alpha) \text{ for some regular expression } \alpha$$

5. Further Reading

## Definitions

- homomorphism is mapping  $h: \Sigma^* \rightarrow \Gamma^*$  such that  $h(\epsilon) = \epsilon$  and  $h(xy) = h(x)h(y)$
- if  $A \subseteq \Sigma^*$  then  $h(A) = \{h(x) \mid x \in A\} \subseteq \Gamma^*$  "image of  $A$  under  $h$ "
- if  $B \subseteq \Gamma^*$  then  $h^{-1}(B) = \{x \mid h(x) \in B\} \subseteq \Sigma^*$  "preimage of  $B$  under  $h$ "

## Theorem

regular sets are effectively closed under homomorphic image and preimage

## Theorem

are decidable

## Automata

- (deterministic, non-deterministic, alternating) **finite automata**
- regular expressions
- (alternating) Büchi automata

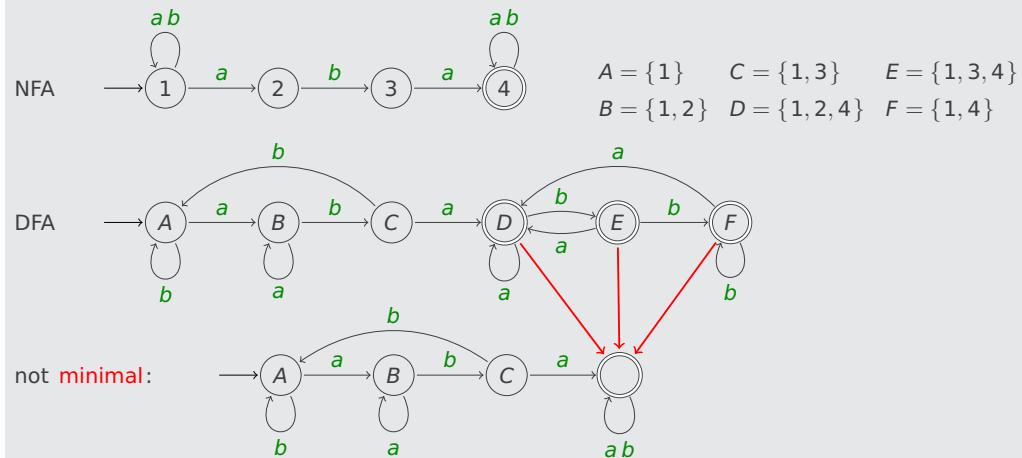

## Logic

- (weak) monadic second-order logic
- Presburger arithmetic
- linear-time temporal logic

## Outline

1. Summary of Previous Lecture
2. Minimization
3. Intermezzo
4. Weak Monadic Second-Order Logic
5. Further Reading

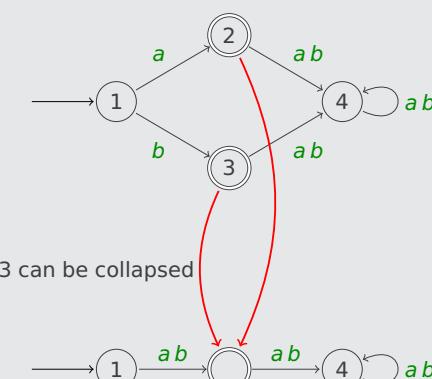

### Example ①

### Example ②

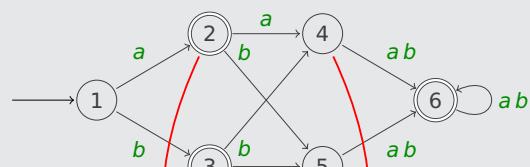

DFA

not minimal: states 2 and 3 can be collapsed

### Example 3

DFA

not **minimal**: states 2 and 3 and states 4 and 5 can be collapsed

## Definitions

DFA  $M = (Q, \Sigma, \delta, s, F)$

- state  $p$  is **inaccessible** if  $\widehat{\delta}(s, x) \neq p$  for all  $x \in \Sigma^*$
  - states  $p$  and  $q$  are **distinguishable** if

$$(\widehat{\delta}(p, x) \in F \wedge \widehat{\delta}(q, x) \notin F) \vee (\widehat{\delta}(p, x) \notin F \wedge \widehat{\delta}(q, x) \in F)$$

for some  $x \in \Sigma^*$

## Minimization Algorithm

DFA  $M = (Q, \Sigma, \delta, s, F)$

- ① remove inaccessible states
  - ② for every two different states determine whether they are distinguishable (marking)
  - ③ collapse indistinguishable states

## Marking Algorithm

given DFA  $M = (Q, \Sigma, \delta, s, F)$  without inaccessible states

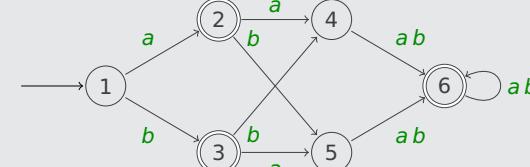

- ① tabulate all unordered pairs  $\{p, q\}$  with  $p, q \in Q$ , initially unmarked
  - ② mark  $\{p, q\}$  if  $p \in F$  and  $q \notin F$  or  $p \notin F$  and  $q \in F$
  - ③ repeat until no change:
    - mark  $\{p, q\}$  if  $\{\delta(p, a), \delta(q, a)\}$  is marked for some  $a \in \Sigma$

## Notation

$p \approx q \iff$  states  $p$  and  $q$  are indistinguishable

## Lemma

$p \approx q \iff \{p, q\}$  is unmarked

- 1
  - ✓ 2
  - ✓ 3
  - ✓ ✓ ✓ 4
  - ✓ ✓ ✓ 5
  - ✓ ✓ ✓ ✓ ✓ 6

- ① final / non-final states are distinguishable
  - ②  $\{2, 6\} \xrightarrow{a} \{4, 6\}$     $\{3, 6\} \xrightarrow{a} \{5, 6\}$
  - ③  $\{1, 4\} \xrightarrow{a} \{2, 6\}$     $\{1, 5\} \xrightarrow{a} \{2, 6\}$

collapse states 2 and 3 and states 4 and 5

## Definition

states  $p$  and  $q$  of DFA  $M = (Q, \Sigma, \delta, s, F)$  are **indistinguishable** ( $p \approx q$ ) if for all  $x \in \Sigma^*$

$$\widehat{\delta}(p, x) \in F \iff \widehat{\delta}(q, x) \in F$$

## Lemma

$\approx$  is equivalence relation on  $Q$ :

- ①  $\forall p \in Q \quad p \approx p$  (reflexivity)
  - ②  $\forall p, q \in Q \quad p \approx q \implies q \approx p$  (symmetry)
  - ③  $\forall p, q, r \in Q \quad p \approx q \wedge q \approx r \implies p \approx r$  (transitivity)

## Notation

$[p]_{\approx} = \{q \in Q \mid p \approx q\}$  denotes equivalence class of  $p$

## Theorem

$$L(M/\approx) = L(M)$$

Proof

$$x \in L(M/\approx) \iff \widehat{\delta}^*([s]_\approx, x) \in F' \iff [\widehat{\delta}(s, x)]_\approx \in F' \iff \widehat{\delta}(s, x) \in F \iff x \in L(M)$$

## Question

is  $M/\approx$  minimum-state DFA for  $L(M)$ ?

## Lemma

$M/\approx$  cannot be collapsed further

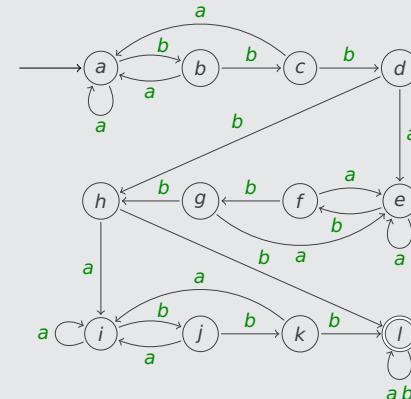

## Definition (Collapsing Indistinguishable States)

DFA  $M/\approx$  is defined as  $(Q', \Sigma, \delta', s', F')$  with

- ▶  $Q' = \{[p]_{\approx} \mid p \in Q\}$
  - ▶  $\delta'([p]_{\approx}, a) = [\delta(p, a)]_{\approx}$       well-defined:  $p \approx q \implies \delta(p, a) \approx \delta(q, a)$
  - ▶  $s' = [s]_{\approx}$
  - ▶  $F' = \{[p]_{\approx} \mid p \in F\}$

## Lemma

- ①**  $\widehat{\delta}'([p]_{\approx}, x) = [\widehat{\delta}(p, x)]_{\approx}$  for all  $x \in \Sigma^*$
  - ②**  $p \in F \iff [p]_{\approx} \in F'$

states  $d$ ,  $a$  and  $b$ ,  $k$  can be merged

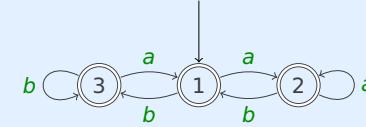

# Outline

1. Summary of Previous Lecture
2. Minimization
3. **Intermezzo**
4. Weak Monadic Second-Order Logic
5. Further Reading

## Question

Which statements about the following DFA are true ?

- A states 2 and 3 are distinguishable
- B all states can be merged
- C the DFA is minimal
- D states 1 and 2 can be merged

# Outline

1. Summary of Previous Lecture
2. Minimization
3. **Intermezzo**
4. **Weak Monadic Second-Order Logic**
5. Further Reading

## Definitions

- first-order variables  $V_1 = \{x, y, \dots\}$  ranging over natural numbers
- second-order variables  $V_2 = \{X, Y, \dots\}$  ranging over finite sets of natural numbers
- formulas of **weak monadic second-order logic**

$$\varphi ::= \perp \mid x < y \mid X(x) \mid \neg\varphi \mid \varphi_1 \vee \varphi_2 \mid \exists x. \varphi \mid \exists X. \varphi$$

with  $x, y \in V_1$  and  $X \in V_2$

## Abbreviations

$$\begin{array}{ll} \varphi \wedge \psi := \neg(\neg\varphi \vee \neg\psi) & \varphi \rightarrow \psi := \neg\varphi \vee \psi \\ \forall x. \varphi := \neg\exists x. \neg\varphi & \forall X. \varphi := \neg\exists X. \neg\varphi \\ x \leqslant y := \neg(y < x) & x = y := x \leqslant y \wedge y \leqslant x \\ \top := \neg\perp & x = 0 := \neg\exists y. y < x \\ X(0) := \exists x. X(x) \wedge x = 0 & \end{array}$$

## Remarks

- $X(x)$  represents  $x \in X$
- MSO is weak MSO without restriction to finite sets

## Examples

- $(\forall x. X(x) \rightarrow Y(x)) \wedge (\exists y. \neg X(y) \wedge Y(y))$
- $\exists X. (\forall x. x = 0 \rightarrow X(x)) \wedge (\forall x. X(x) \rightarrow \exists y. x < y \wedge X(y))$
- $\exists X. X(0) \wedge (\forall y. \forall z. z = y + 1 \wedge z \leq x \rightarrow (X(y) \leftrightarrow \neg X(z))) \wedge X(x) \iff x \text{ is even}$

## Remark

$z = y + 1$  abbreviates  $y < z \wedge \neg \exists x. (y < x \wedge x < z)$

## Definitions

- assignment  $\alpha$  is mapping from variables  $x \in V_1$  to  $\mathbb{N}$  and  $X \in V_2$  to finite subsets of  $\mathbb{N}$
- assignment  $\alpha$  satisfies formula  $\varphi$  ( $\alpha \models \varphi$ ):

$$\begin{aligned}\alpha \not\models \perp & \\ \alpha \models x < y &\iff \alpha(x) < \alpha(y) \\ \alpha \models X(x) &\iff \alpha(x) \in \alpha(X) \\ \alpha \models \neg \varphi &\iff \alpha \not\models \varphi \\ \alpha \models \varphi_1 \vee \varphi_2 &\iff \alpha \models \varphi_1 \text{ or } \alpha \models \varphi_2 \\ \alpha \models \exists x. \varphi &\iff \alpha[x \mapsto n] \models \varphi \quad \text{for some } n \in \mathbb{N} \\ \alpha \models \exists X. \varphi &\iff \alpha[X \mapsto N] \models \varphi \quad \text{for some finite subset } N \subset \mathbb{N}\end{aligned}$$

## Definitions

- formula  $\varphi$  is satisfiable if  $\alpha \models \varphi$  for some assignment  $\alpha$
- formula  $\varphi$  is valid if  $\alpha \models \varphi$  for all assignments  $\alpha$
- model of formula  $\varphi$  is assignment  $\alpha$  such that  $\alpha \models \varphi$
- size of model  $\alpha$  is smallest  $n$  such that
  - $\alpha(x) < n$  for  $x \in V_1$
  - $\alpha(X) \subseteq \{0, \dots, n-1\}$  for  $X \in V_2$

## Examples

- |  |               |
|--|---------------|
| ► $(\forall x. X(x) \rightarrow Y(x)) \wedge (\exists y. \neg X(y) \wedge Y(y))$   | satisfiable   |
| ► $(\forall x. x = 0 \rightarrow X(x)) \wedge (\forall x. X(x) \rightarrow \exists y. x < y \wedge X(y))$                      | unsatisfiable |
| ► $(\exists x. X(x) \wedge \exists y. X(y) \wedge x \neq y) \wedge (\forall x. X(x) \rightarrow \exists y. Y(y) \wedge x < y)$ | satisfiable   |

## Definition

- given alphabet  $\Sigma$  and string  $x = a_0 \dots a_{n-1} \in \Sigma^*$
- second-order variables  $V_2 = \{P_a \mid a \in \Sigma\}$
  - $\alpha_x(P_a) = \{i < n \mid a_i = a\}$

## Notation

$\underline{x}$  for  $\alpha_x$

## Example

- $\Sigma = \{\textcolor{red}{a}, \textcolor{blue}{b}\}$
- $\underline{abba}(P_{\textcolor{red}{a}}) = \{0, 3\}$
  - $\underline{abba}(P_{\textcolor{blue}{b}}) = \{1, 2\}$

## Example

$\Sigma = \{a, b\}$

- $\varphi = \forall x. \neg(P_a(x) \wedge P_b(x))$        $\underline{x} \models \varphi$  for all  $x \in \Sigma^*$
- $\psi = \forall x. \forall y. (P_a(x) \wedge P_b(y)) \rightarrow x < y$       aabb  $\models \psi$       aabab  $\not\models \psi$
- $\chi = \forall x. P_b(x) \rightarrow \exists y. P_a(y) \wedge y < x$       aaaaa  $\models \chi$       babab  $\not\models \chi$

## Definitions

- given alphabet  $\Sigma$  and WMSO formula  $\varphi$  with free variables (exclusively) in  $\{P_a \mid a \in \Sigma\}$

$$L(\varphi) = \{x \in \Sigma^* \mid \underline{x} \models \varphi\}$$

- set  $A \subseteq \Sigma^*$  is **WMSO definable** if  $A = L(\varphi)$  for some WMSO formula  $\varphi$

## Outline

1. Summary of Previous Lecture
2. Minimization
3. Intermezzo
4. Weak Monadic Second-Order Logic
5. Further Reading

## Examples

$\Sigma = \{a, b\}$

- regular set  $L((a+b)^*ab(a+b)^*)$  is WMSO definable by formula
- $$\exists x. \exists y. P_a(x) \wedge P_b(y) \wedge x < y \wedge \neg \exists z. x < z \wedge z < y$$

- WMSO formula

$$\exists x. P_a(x) \wedge \forall y. x < y \rightarrow \neg(P_a(y) \vee P_b(y))$$

defines regular set  $\{xa \mid x \in \Sigma^*\}$

## Theorem

set  $A \subseteq \Sigma^*$  is regular if and only if  $A$  is WMSO definable

## Kozen

- Lectures 13 and 14

## Important Concepts

- $\alpha \models \varphi$
- indistinguishable states
- minimization algorithm
- model
- MSO
- satisfiability
- validity
- weak monadic second-order logic (WMSO)
- WMSO definability

homework for November 8
