

Introduction to Term Rewriting lecture 9

Aart Middeldorp and Femke van Raamsdonk

Institute of Computer Science
University of Innsbruck

Department of Computer Science
VU Amsterdam

Sunday

introduction, examples, abstract rewriting, equational reasoning, term rewriting

Monday

termination, completion

Tuesday

completion, termination

Wednesday

confluence, modularity, **strategies**

Thursday

exam, advanced topics

Outline

- Strategies
 - Definitions
 - Results
 - Optimality
- Strategy Annotations
- Further Reading

Definition

- rewrite strategy \mathcal{S} is mapping that assigns to every reducible term t nonempty set of finite nonempty rewrite sequences starting from t
- rewrite strategy \mathcal{S} is **deterministic** if $\mathcal{S}(t)$ contains exactly one rewrite sequence for every reducible term t
- rewrite strategy \mathcal{S} **normalizes** term t if there are no infinite \mathcal{S} rewrite sequences starting from t
- rewrite strategy \mathcal{S} is **normalizing** if it normalizes every term that has normal form
- rewrite strategy \mathcal{S} is **perpetual** if every maximal \mathcal{S} rewrite sequence starting from any non-terminating term is infinite

Lemma

for terminating TRSs every strategy is **normalizing** and **perpetual**

Example

- rewrite rules

$0 + 0 \rightarrow 0$	$1 + 0 \rightarrow 1$	\dots	$9 + 0 \rightarrow 9$
$0 + 1 \rightarrow 1$	$1 + 1 \rightarrow 2$	\dots	$9 + 1 \rightarrow 1 : 0$
$0 + 2 \rightarrow 2$	$1 + 2 \rightarrow 3$	\dots	$9 + 2 \rightarrow 1 : 1$
$0 + 3 \rightarrow 3$	$1 + 3 \rightarrow 4$	\dots	$9 + 3 \rightarrow 1 : 2$
$0 + 4 \rightarrow 4$	$1 + 4 \rightarrow 5$	\dots	$9 + 4 \rightarrow 1 : 3$
$0 + 5 \rightarrow 5$	$1 + 5 \rightarrow 6$	\dots	$9 + 5 \rightarrow 1 : 4$
$0 + 6 \rightarrow 6$	$1 + 6 \rightarrow 7$	\dots	$9 + 6 \rightarrow 1 : 5$
$0 + 7 \rightarrow 7$	$1 + 7 \rightarrow 8$	\dots	$9 + 7 \rightarrow 1 : 6$
$0 + 8 \rightarrow 8$	$1 + 8 \rightarrow 9$	\dots	$9 + 8 \rightarrow 1 : 7$
$0 + 9 \rightarrow 9$	$1 + 9 \rightarrow 1 : 0$	\dots	$9 + 9 \rightarrow 1 : 8$
$x + (y : z) \rightarrow y : (x + z)$			$0 : x \rightarrow x$
$(x : y) + z \rightarrow x : (y + z)$			$x : (y : z) \rightarrow (x + y) : z$

- term

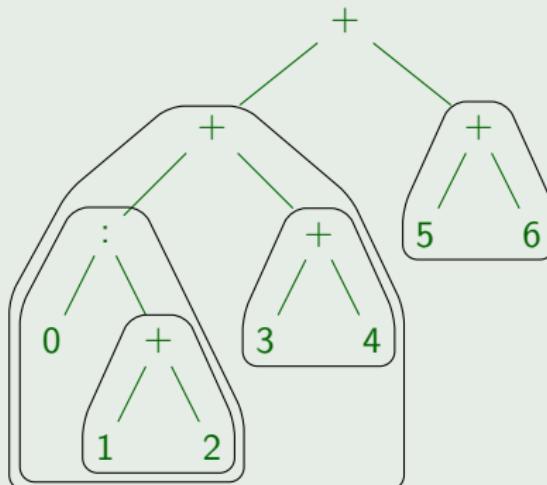

$$((0 : (1 + 2)) + (3 + 4)) + (5 + 6)$$

Example (cont'd)

term

$$0 : \boxed{1 + 2} + \boxed{3 + 4} + \boxed{5 + 6}$$

tree representation

parallel/leftmost outermost/innermost strategies

Example (cont'd)

- **leftmost outermost** strategy 12 redexes

$$\begin{aligned} & ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) \\ \rightarrow & (0 : ((1 + 2) + (3 + 4))) + (5 + 6) \\ \rightarrow & 0 : (((1 + 2) + (3 + 4)) + (5 + 6)) \\ \rightarrow & ((1 + 2) + (3 + 4)) + (5 + 6) \rightarrow (3 + (3 + 4)) + (5 + 6) \\ \rightarrow & (3 + 7) + (5 + 6) \rightarrow (1 : 0) + (5 + 6) \rightarrow 1 : (0 + (5 + 6)) \\ \rightarrow & 1 : (0 + (1 : 1)) \rightarrow 1 : (1 : (0 + 1)) \rightarrow (1 + 1) : (0 + 1) \\ \rightarrow & 2 : (0 + 1) \rightarrow 2 : 1 \end{aligned}$$

- **leftmost innermost** strategy 10 redexes

$$\begin{aligned} & (0 : (1 + 2)) + (3 + 4) + (5 + 6) \\ \rightarrow & ((0 : 3) + (3 + 4)) + (5 + 6) \rightarrow (3 + (3 + 4)) + (5 + 6) \\ \rightarrow & (3 + 7) + (5 + 6) \rightarrow (1 : 0) + (5 + 6) \rightarrow (1 : 0) + (1 : 1) \\ \rightarrow & 1 : (0 + (1 : 1)) \rightarrow 1 : (1 : (0 + 1)) \rightarrow 1 : (1 : 1) \\ \rightarrow & (1 + 1) : 1 \rightarrow 2 : 1 \end{aligned}$$

Example (cont'd)

- parallel outermost strategy 12 redexes in 9 steps

$$\begin{aligned} & ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) \\ \not\rightarrow & (0 : ((1 + 2) + (3 + 4))) + (1 : 1) \\ \rightarrow & 0 : (((1 + 2) + (3 + 4)) + (1 : 1)) \\ \rightarrow & ((1 + 2) + (3 + 4)) + (1 : 1) \\ \rightarrow & 1 : (((1 + 2) + (3 + 4)) + 1) \\ \not\rightarrow & 1 : ((3 + 7) + 1) \rightarrow 1 : ((1 : 0) + 1) \rightarrow 1 : (1 : (0 + 1)) \\ \rightarrow & (1 + 1) : (0 + 1) \not\rightarrow 2 : 1 \end{aligned}$$

- parallel innermost strategy 10 redexes in 8 steps

$$\begin{aligned} & ((0 : (1 + 2)) + (3 + 4)) + (5 + 6) \\ \not\rightarrow & ((0 : 3) + 7) + (1 : 1) \rightarrow (3 + 7) + (1 : 1) \\ \rightarrow & (1 : 0) + (1 : 1) \rightarrow 1 : (0 + (1 : 1)) \rightarrow 1 : (1 : (0 + 1)) \\ \rightarrow & 1 : (1 : 1) \rightarrow (1 + 1) : 1 \rightarrow 2 : 1 \end{aligned}$$

Definition

development of set of redex positions Q in term t is rewrite sequence starting from t in which all contracted redex positions descend from position in Q

Example

- rewrite rules

$$\begin{array}{ll} 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\ s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y \end{array}$$

- rewrite sequences

$$\underline{s(0) \times (0 \times 0)} \rightarrow \underline{(0 \times (0 \times 0))} + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😊}$$

$$\underline{s(0) \times (0 \times 0)} \rightarrow \underline{(0 \times (0 \times 0))} + (0 \times 0) \rightarrow (0 \times 0) + (0 \times 0) \quad \text{😢}$$

$$s(0) \times \underline{(0 \times 0)} \rightarrow s(0) \times 0 \rightarrow (0 \times 0) + 0 \quad \text{😊}$$

Theorem

developments are finite

Definition

development $A: s \rightarrow^* t$ of set of redex positions $Q \subseteq \text{Pos}(s)$ is **complete** if
 $Q \setminus A = \emptyset$

Lemma

for orthogonal TRSs: $s \rightarrow^* t$ is complete development $\iff s \rightarrow\!\!\! \rightarrow t$

Theorem

all complete developments of Q are **permutation equivalent**

Definition

for orthogonal TRSs **full substitution** strategy performs **complete development** of all redexes

Example

- rewrite rules

$$\begin{array}{ll} 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\ s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y \end{array}$$

- full substitution strategy

$$\begin{aligned} & s(s(0)) \times (s(0) + s(s(0))) \\ \xrightarrow{\quad} & (s(0) \times s(0 + s(s(0)))) + s(0 + s(s(0))) \\ \xrightarrow{\quad} & ((0 \times s(s(0))) + s(s(s(0)))) + s(s(s(0))) \\ \rightarrow & (0 + s(s(s(0)))) + s(s(s(0))) \\ \rightarrow & s(s(s(0))) + s(s(s(0))) \xrightarrow{+} s(s(s(s(s(0)))))) \end{aligned}$$

Outline

- Strategies
 - Definitions
 - Results
 - Optimality
- Strategy Annotations
- Further Reading

Theorem

for orthogonal TRSs

- full substitution and parallel outermost strategies are *normalizing*
- innermost strategies are *perpetual*
- leftmost outermost strategy is *not* normalizing

Example

$$a \rightarrow b$$

$$c \rightarrow c$$

$$f(x, b) \rightarrow b$$

- leftmost outermost $f(c, a) \rightarrow f(c, a) \rightarrow f(c, a) \rightarrow \dots$
- leftmost innermost $f(c, a) \rightarrow f(c, a) \rightarrow f(c, a) \rightarrow \dots$
- parallel outermost $f(c, a) \uplus f(c, b) \rightarrow b$
- parallel innermost $f(c, a) \uplus f(c, b) \rightarrow f(c, b) \rightarrow \dots$
- full substitution $f(c, a) \multimap f(c, b) \multimap b$

Definition

TRS is **left-normal** if variables do not precede function symbols in left-hand sides

Example

- $x + (y : z) \rightarrow y : (x + z)$ ☹
- $(x : y) + z \rightarrow x : (y + z)$ ☺

Theorem

leftmost outermost strategy is normalizing for orthogonal left-normal TRSs

Remark

easy but **important result**: Combinatory Logic is left-normal

$$I x \rightarrow x$$

$$K x y \rightarrow x$$

$$S x y z \rightarrow x z (y z)$$

Innsbruck

PhD Positions in Innsbruck

- 1 3-year FWF project position (advisor: Dr. René Thiemann)
 - certification of termination methods in Isabelle/HOL
- 2 4-year university position from October 1, 2010
- 3 4-year university position from April 1, 2011

Requirements

- master degree in computer science or mathematics
- interest in computational logic – term rewriting – theorem proving

Further Information

- Aart Middeldorp

Outline

- Strategies
 - Definitions
 - Results
 - Optimality
- Strategy Annotations
- Further Reading

Observation

parallel outermost and full-substitution are not **optimal** because they perform **useless steps**

Example

- rewrite rules

$$\begin{array}{ll} 0 + y \rightarrow y & 0 \times y \rightarrow 0 \\ s(x) + y \rightarrow s(x + y) & s(x) \times y \rightarrow (x \times y) + y \end{array}$$

- rewrite sequence

$$(0 \times s(0)) \times (0 + s(0)) \not\rightarrow 0 \times s(0) \rightarrow 0$$

- redex $0 + s(0)$ is not **needed**

Definition

redex Δ in term t is **needed** if descendant of Δ is contracted in every rewrite sequence from t to normal form

Theorem

for orthogonal TRSs

- every reducible term has needed redex
- needed reduction is normalizing

Unfortunately

for orthogonal TRSs it is **undecidable** whether redex is needed

Remark

decidable approximations based on powerful tree automata techniques exist

Lemma

for **left-normal** orthogonal TRSs **leftmost outermost** redex is needed

Outline

- Strategies
 - Definitions
 - Results
 - Optimality
- Strategy Annotations
- Further Reading

Example

rewrite rules

$$\begin{array}{lll} \alpha: \text{and}(x, T) \rightarrow x & \gamma: \text{or}(T, x) \rightarrow T & \epsilon: \infty \rightarrow \infty \\ \beta: \text{and}(x, F) \rightarrow F & \delta: \text{or}(F, x) \rightarrow x & \end{array}$$

strategy annotation A

$$A(\text{and}) = [2, \alpha, \beta, 1] \quad A(\text{or}) = [1, \gamma, \delta, 2] \quad A(\infty) = [\epsilon]$$

evaluation

$$\begin{aligned} \text{or}(\text{and}(\infty, F), \text{or}(T, \infty)) &\rightarrow \text{or}(F, \text{or}(T, \infty)) \\ &\rightarrow \text{or}(T, \infty) \\ &\rightarrow T \end{aligned}$$

Definitions

- **strategy annotation** for function symbol f is finite list $A(f)$ containing
 - argument positions of f
 - (labels of) rewrite rules for f
- strategy annotation $A(f)$ for function symbol f is **full** if $A(f)$ contains all argument positions of f and all rewrite rules for f
- strategy annotation $A(f)$ for function symbol f is **in-time** if argument positions are listed in $A(f)$ before rewrite rules that **need** them
- rewrite rule $f(s_1, \dots, s_n) \rightarrow t$ **needs** argument position i if
 - s_i is non-variable
 - s_i is variable that appears in $s_1, \dots, s_{i-1}, s_{i+1}, \dots, s_n$

Example

rewrite rules

$$\alpha: \text{if}(\text{T}, x, y) \rightarrow x \quad \beta: \text{if}(\text{F}, x, y) \rightarrow y \quad \gamma: \text{if}(z, x, x) \rightarrow x$$

strategy annotations

	full	in-time
$A_1(\text{if}) = [1, \alpha, \beta, 2, 3, \gamma]$	😊	😊
$A_2(\text{if}) = [\alpha, \beta, 1, 2, 3, \gamma]$	😊	😢
$A_3(\text{if}) = [1, \alpha, \beta, \gamma, 2, 3]$	😊	😢
$A_4(\text{if}) = [1, \alpha, \beta]$	😢	😊

Definition

$$\text{find-redex}_A(t) = \text{find-redex}_A(t, A(\text{root}(t)))$$

$$\text{find-redex}_A(t, [\]) = \perp$$

$$\text{find-redex}_A(t, [\ell \rightarrow r \mid L]) = \begin{cases} (\epsilon, r\sigma) & \text{if } t = \ell\sigma \\ \text{find-redex}_A(t, L) & \text{otherwise} \end{cases}$$

$$\text{find-redex}_A(t, [i \mid L]) = \begin{cases} (ip, u) & \text{if } \text{find-redex}_A(t|_i) = (p, u) \\ \text{find-redex}_A(t, L) & \text{otherwise} \end{cases}$$

Theorem

\forall full strategy annotation A \forall term t

$$\text{find-redex}_A(t) = \perp \iff t \text{ is normal form}$$

Example

rewrite rules

$$\begin{array}{lll} \alpha: \text{and}(x, T) \rightarrow x & \gamma: \text{or}(T, x) \rightarrow T & \epsilon: \infty \rightarrow \infty \\ \beta: \text{and}(x, F) \rightarrow F & \delta: \text{or}(F, x) \rightarrow x & \end{array}$$

strategy annotation A

$$A(\text{and}) = [2, \alpha, \beta, 1] \quad A(\text{or}) = [1, \gamma, \delta, 2] \quad A(\infty) = [\epsilon]$$

evaluation

$$\begin{aligned} \text{find-redex}_A(\text{or}(\text{and}(\infty, F), \text{or}(T, \infty))) \\ = \text{find-redex}_A(\text{or}(\text{and}(\infty, F), \text{or}(T, \infty)), [1, \gamma, \delta, 2]) = (1, F) \end{aligned}$$

$$\begin{aligned} \text{find-redex}_A(\text{and}(\infty, F)) \\ = \text{find-redex}_A(\text{and}(\infty, F), [2, \alpha, \beta, 1]) \\ = \text{find-redex}_A(\text{and}(\infty, F), [\alpha, \beta, 1]) \\ = \text{find-redex}_A(\text{and}(\infty, F), [\beta, 1]) = (\epsilon, F) \end{aligned}$$

$$\text{find-redex}_A(F) = \perp$$

Example

rewrite rules

$$\alpha: \text{if}(\text{T}, x, y) \rightarrow x \quad \beta: \text{if}(\text{F}, x, y) \rightarrow y \quad \gamma: \text{if}(z, x, x) \rightarrow x$$

strategy annotation

$$A(\text{if}) = [1, \alpha, 2, 3, \gamma]$$

$$\text{find-redex}_A(\text{if}(\text{F}, \text{T}, \text{F})) = \perp \qquad \qquad \text{if}(\text{F}, \text{T}, \text{F}) \rightarrow \text{T}$$

Definition

$$\text{strategy } \mathcal{S}_A(t) = \begin{cases} \emptyset & \text{if } \text{find-redex}_A(t) = \perp \\ \{t \rightarrow t[u]_p\} & \text{if } \text{find-redex}_A(t) = (p, u) \end{cases}$$

Corollary

\forall *full strategy annotation A*

\mathcal{S}_A is rewrite strategy

Definition

$$\text{normalize}_A(t) = \text{normalize}_A(t, A(\text{root}(t)))$$

$$\text{normalize}_A(t, []) = t$$

$$\text{normalize}_A(t, [\ell \rightarrow r \mid L]) = \begin{cases} \text{normalize}_A(r\sigma) & \text{if } t = \ell\sigma \\ \text{normalize}_A(t, L) & \text{otherwise} \end{cases}$$

$$\text{normalize}_A(t, [i \mid L]) = \text{normalize}_A(t[\text{normalize}_A(t|_i)]_i, L)$$

Theorem

\forall *in-time* strategy annotation A \forall term t

$$S_A \text{ normalizes } t \iff \text{normalize}_A(t) \text{ is normal form of } t$$
