Term Rewriting Systems

Terese

Cambridge University Press, 2003

Abstract Rewriting Strategies

Term Rewriting Strategies

Structured Rewriting Strategies

Motivation for Strategies

Controlling non-determinism

Typical Result

Theorem

The needed *strategy* is normalising for combinatory logic.

$$(K \cdot x) \cdot y \rightarrow x$$

$$((S \cdot x) \cdot y) \cdot z \rightarrow (x \cdot z) \cdot (y \cdot z)$$

Typical Result

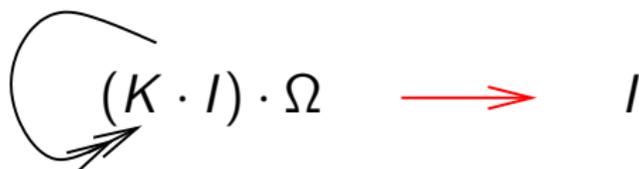

Theorem

The needed *strategy* is normalising for combinatory logic.

$$(K \cdot x) \cdot y \rightarrow x$$

$$((S \cdot x) \cdot y) \cdot z \rightarrow (x \cdot z) \cdot (y \cdot z)$$

Example

$$(K \cdot I) \cdot \Omega \rightarrow I$$

$$I = (S \cdot K) \cdot K$$

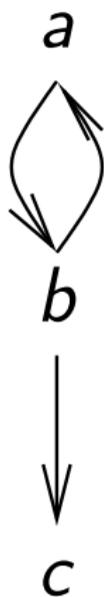

$$\Omega = ((S \cdot I) \cdot I) \cdot ((S \cdot I) \cdot I)$$

ARS strategy

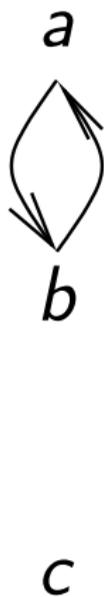

Definition

Strategy is sub-ARS having same objects and normal forms.

ARS strategy example

Examples of strategies

- ▶ Innermost ('call by value')

Examples of strategies

- ▶ Innermost ('call by value')
- ▶ Outermost ('call by name')

Examples of strategies

- ▶ Innermost ('call by value')
- ▶ Outermost ('call by name')
- ▶ Needed ('call by need')

Examples of strategies

- ▶ Innermost ('call by value')
- ▶ Outermost ('call by name')
- ▶ Needed ('call by need')
- ▶ ...

Non-examples of strategies

- ▶ Loop three times and then exit ('history aware')

Non-examples of strategies

- ▶ Loop three times and then exit ('history aware')
- ▶ Reduce to (weak) head-normal form ('semantics change')

Non-examples of strategies

- ▶ Loop three times and then exit ('history aware')
- ▶ Reduce to (weak) head-normal form ('semantics change')
- ▶ Contract innermost redexes ('many step')

Non-examples of strategies

- ▶ Loop three times and then exit ('history aware')
- ▶ Reduce to (weak) head-normal form ('semantics change')
- ▶ Contract innermost redexes ('many step')
- ▶ ...

Inadequacy of **relations** for strategies

Syntactic accident:

Abstract Rewriting Systems

Definition

ARS is a binary relation on a set.

Abstract Rewriting Systems

Definition

ARS is a binary relation on a set.
extensional (existence of steps)

Abstract Rewriting Systems redefined

Definition

ARS is $\langle A, \Phi, \text{src}, \text{tgt} \rangle$

- ▶ A set of **objects**
- ▶ Φ set of **steps**
- ▶ $\text{src}, \text{tgt} : \Phi \rightarrow A$
source and **target** functions

Abstract Rewriting Systems redefined

Definition

ARS is $\langle A, \Phi, \text{src}, \text{tgt} \rangle$

- ▶ A set of **objects**
- ▶ Φ set of **steps**
- ▶ $\text{src}, \text{tgt} : \Phi \rightarrow A$
source and **target** functions

intensional (steps ϕ, ψ, χ, \dots)

Abstract Rewriting Systems redefined

Definition

ARS is $\langle A, \Phi, \text{src}, \text{tgt} \rangle$

- ▶ A set of **objects**
- ▶ Φ set of **steps**
- ▶ $\text{src}, \text{tgt} : \Phi \rightarrow A$
source and **target** functions

intensional (steps ϕ, ψ, χ, \dots)

$\phi : a \rightarrow b$ denotes

ϕ is step with source a and target b

Abstract Rewriting Systems redefined?

Abstract Rewriting Systems redefined?

Equivalently

- ▶ Directed graph
- ▶ Category without composition (no monoid laws)

Deterministic ARS/strategy

Definition

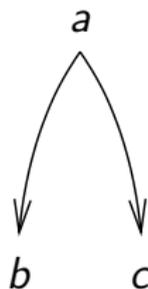

Deterministic if object source of at most one step

Deterministic ARS/strategy

Definition

Deterministic if object source of at most one step

no **forks**

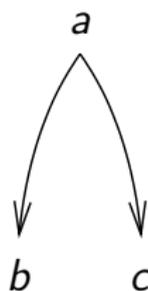

(possibly $b = c$)

Deterministic ARS/strategy

Definition

Deterministic if object source of at most one step

no **forks**

(possibly $b = c$)

Lemma

a deterministic strategy always exists

(simply choose one step from each source)

Facts on strategies

- ▶ strategy for strategy is strategy

Facts on strategies

- ▶ strategy for strategy is strategy
- ▶ deterministic strategy has only one strategy

Facts on strategies

- ▶ strategy for strategy is strategy
- ▶ deterministic strategy has only one strategy
- ▶ termination preserved, **not** reflected

Facts on strategies

- ▶ strategy for strategy is strategy
- ▶ deterministic strategy has only one strategy
- ▶ termination preserved, **not** reflected
- ▶ normalising reflected, **not** preserved

Facts on strategies

- ▶ strategy for strategy is strategy
- ▶ deterministic strategy has only one strategy
- ▶ termination preserved, **not** reflected
- ▶ normalising reflected, **not** preserved
- ▶ confluence **neither** preserved **nor** reflected

Reduction sequences

Many-step ARS \rightarrow^+ :

- ▶ Objects: objects of \rightarrow
- ▶ Steps: non-empty reduction sequences of \rightarrow
- ▶ source of sequence is source of first step
target of sequence is target of last step

Reduction sequences

Many-step ARS \rightarrow^+ :

- ▶ Objects: objects of \rightarrow
- ▶ Steps: non-empty reduction sequences of \rightarrow
- ▶ source of sequence is source of first step
target of sequence is target of last step

reduction sequences can be composed (**associative**)

Many-step strategy

Definition

Many-step strategy for \rightarrow is strategy for \rightarrow^+

Many-step strategy

Definition

Many-step strategy for \rightarrow is strategy for \rightarrow^+

(Non-)examples:

- ▶ Loop three times and then exit ('not single-step')

Many-step strategy

Definition

Many-step strategy for \rightarrow is strategy for \rightarrow^+

(Non-)examples:

- ▶ Loop three times and then exit ('not single-step')
- ▶ Reduce to (weak) head-normal form ('semantics change')

Many-step strategy

Definition

Many-step strategy for \rightarrow is strategy for \rightarrow^+

(Non-)examples:

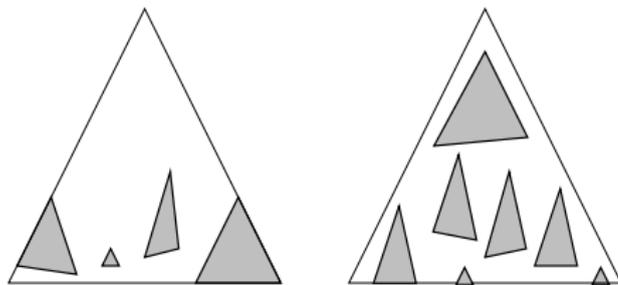

- ▶ Loop three times and then exit ('not single-step')
- ▶ Reduce to (weak) head-normal form ('semantics change')
- ▶ **Contract innermost redexes**

ARS as term rewriting strategy?

ARS as term rewriting strategy?

No, not in general: ARSs lack structure to express

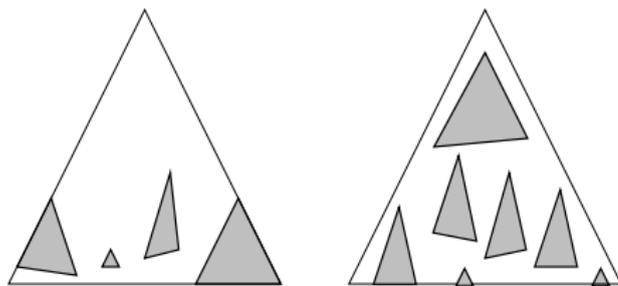

- ▶ Parallel strategies
- ▶ Multi-step strategies

ARS as term rewriting strategy?

No, not in general: ARSs lack structure to express

- ▶ Parallel strategies
- ▶ Multi-step strategies

Need **structured** objects
terms, graphs, ...

Equational logic inference system

$$\frac{s \rightarrow t}{s = t} \text{ (rule)} \quad \frac{s = t}{s^\sigma = t^\sigma} \text{ (substitution)}$$

$$\frac{s_1 = t_1 \quad \dots \quad s_n = t_n}{f(s_1, \dots, s_n) = f(t_1, \dots, t_n)} \text{ (congruence)}$$

$$\frac{}{s = s} \text{ (reflexive)} \quad \frac{s = t}{t = s} \text{ (symmetric)} \quad \frac{s = t \quad t = u}{s = u} \text{ (transitive)}$$

Equational logic inference system

$$\frac{s \rightarrow t}{s = t} \text{ (rule)} \quad \frac{s = t}{s^\sigma = t^\sigma} \text{ (substitution)}$$

$$\frac{s_1 = t_1 \quad \dots \quad s_n = t_n}{f(s_1, \dots, s_n) = f(t_1, \dots, t_n)} \text{ (congruence)}$$

$$\frac{}{s = s} \text{ (reflexive)} \quad \frac{s = t}{t = s} \text{ (symmetric)} \quad \frac{s = t \quad t = u}{s = u} \text{ (transitive)}$$

Theorem

$$t \approx s \iff t \leftrightarrow^* s \iff t = s$$

Equational logic inference example

Inference of $l \cdot (l \cdot t) = l \cdot t$?

Equational logic inference example

Inference of $l \cdot (l \cdot t) = l \cdot t$?

$$\frac{l \cdot x \rightarrow x}{l \cdot x = x} \text{ (rule)}$$
$$\frac{l \cdot x = x}{l \cdot (l \cdot t) = l \cdot t} \text{ (subst)}$$

Equational logic inference example

Inference of $l \cdot (l \cdot t) = l \cdot t$?

$$\frac{\frac{l \cdot x \rightarrow x}{l \cdot x = x} \text{ (rule)}}{l \cdot (l \cdot t) = l \cdot t} \text{ (subst)}$$
$$\frac{\frac{}{l = l} \text{ (reflexive)} \quad \frac{\frac{l \cdot x \rightarrow x}{l \cdot x = x} \text{ (rule)}}{l \cdot t = t} \text{ (subst)}}{l \cdot (l \cdot t) = l \cdot t} \text{ (congruence)}$$

Equational logic inference example

Inference of $l \cdot (l \cdot t) = l \cdot t$?

$$\frac{\frac{l \cdot x \rightarrow x}{l \cdot x = x} \text{ (rule)}}{l \cdot (l \cdot t) = l \cdot t} \text{ (subst)}$$
$$\frac{\frac{}{l = l} \text{ (reflexive)} \quad \frac{\frac{l \cdot x \rightarrow x}{l \cdot x = x} \text{ (rule)}}{l \cdot t = t} \text{ (subst)}}{l \cdot (l \cdot t) = l \cdot t} \text{ (congruence)}$$

Distinct proofs!

Idea: **Proofs as steps**

Equational logic inference example

Inference of $l \cdot (l \cdot t) = l \cdot t$?

How to represent proofs?

Idea: **Proofs as terms**

Representing proofs as terms

Useful since then rewriting machinery applicable

Representing proofs as terms

Useful since then rewriting machinery applicable

outer represented by $\varrho(l \cdot t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

inner represented by $l \cdot \varrho(t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

Representing proofs as terms

Useful since then rewriting machinery applicable

outer represented by $\varrho(I \cdot t) : I \cdot (I \cdot t) \rightarrow I \cdot t$

inner represented by $I \cdot \varrho(t) : I \cdot (I \cdot t) \rightarrow I \cdot t$

- ▶ Turn **rewrite rules** into **function symbols**

E.g. $I \cdot x \rightarrow x$ turns into ϱ

unary since the rule has one free variable.

Representing proofs as terms

Useful since then rewriting machinery applicable

outer represented by $\varrho(l \cdot t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

inner represented by $l \cdot \varrho(t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

- ▶ Turn **rewrite rules** into **function symbols**

E.g. $l \cdot x \rightarrow x$ turns into ϱ

unary since the rule has one free variable.

- ▶ Reflexivity is superfluous on ground terms (**congruence**)

E.g. $l \geq l$ also follows by (congruence)

$\text{tgt}(t) = t = \text{src}(t)$ if t ground

Representing proofs as terms

Useful since then rewriting machinery applicable

outer represented by $\varrho(l \cdot t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

inner represented by $l \cdot \varrho(t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

- ▶ Turn **rewrite rules** into **function symbols**

E.g. $l \cdot x \rightarrow x$ turns into ϱ

unary since the rule has one free variable.

- ▶ Reflexivity is superfluous on ground terms (**congruence**)

E.g. $l \geq l$ also follows by (congruence)

$\text{tgt}(t) = t = \text{src}(t)$ if t ground

- ▶ Represent (transitivity) by infix \circ

Representing proofs as terms

Useful since then rewriting machinery applicable

outer represented by $\varrho(l \cdot t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

inner represented by $l \cdot \varrho(t) : l \cdot (l \cdot t) \rightarrow l \cdot t$

- ▶ Turn **rewrite rules** into **function symbols**

E.g. $l \cdot x \rightarrow x$ turns into ϱ

unary since the rule has one free variable.

- ▶ Reflexivity is superfluous on ground terms (**congruence**)

E.g. $l \geq l$ also follows by (congruence)

$\text{tgt}(t) = t = \text{src}(t)$ if t ground

- ▶ Represent (transitivity) by infix \circ

What is represented by $\varrho(l \cdot t) \circ \varrho(t)$, and by $\varrho(t \circ t)$?

Restrictions on proof terms

- ▶ **Single step** \rightarrow : no transitivity, exactly one rule

Restrictions on proof terms

- ▶ **Single step** \rightarrow : no transitivity, exactly one rule
- ▶ **Parallel step** \dashrightarrow : no transitivity, no nested rules

Restrictions on proof terms

- ▶ **Single step** \rightarrow : no transitivity, exactly one rule
- ▶ **Parallel step** \leftrightarrow : no transitivity, no nested rules
- ▶ **Multi-step** \multimap : no transitivity

Restrictions on proof terms

- ▶ **Single step** \rightarrow : no transitivity, exactly one rule
- ▶ **Parallel step** \leftrightarrow : no transitivity, no nested rules
- ▶ **Multi-step** \rightarrow^* : no transitivity
- ▶ **Many-step** \rightarrow^+ : transitivity only at root

Examples of Term Rewriting Strategies

- ▶ **Single step**: leftmost-outermost, leftmost-innermost, needed

Examples of Term Rewriting Strategies

- ▶ **Single step**: leftmost-outermost, leftmost-innermost, needed
- ▶ **Parallel step**: parallel outermost, parallel innermost

Examples of Term Rewriting Strategies

- ▶ **Single step**: leftmost-outermost, leftmost-innermost, needed
- ▶ **Parallel step**: parallel outermost, parallel innermost
- ▶ **Multi-step**: full-substitution (Gross–Knuth)

Higher-order rewriting strategies

Same procedure

1. Higher-order **equational logic**

Formats differ in types allowed and in way $\beta\eta\alpha$ are combined with rules, but **same** logic

Higher-order rewriting strategies

Same procedure

1. Higher-order **equational logic**
Formats differ in types allowed and in way $\beta\eta\alpha$ are combined with rules, but **same** logic
2. Higher-order **proof terms**
by injecting rules as symbols into signature

Higher-order rewriting strategies

Same procedure

1. Higher-order **equational logic**
Formats differ in types allowed and in way $\beta\eta\alpha$ are combined with rules, but **same** logic
2. Higher-order **proof terms**
by injecting rules as symbols into signature
3. Strategies as **restriction** of higher-order proof terms.

Higher-order rewriting strategies
