Complexity Classes

Complexity Classes

- classes like P

Complexity Classes

- classes like P, NP

Complexity Classes

- classes like P, NP, EXP

Complexity Classes

- classes like P, NP, EXP, LOGSPACE

Complexity Classes

- classes like P, NP, EXP, LOGSPACE, ...

Complexity Classes

- classes like P, NP, EXP, LOGSPACE, ...

decision functions which can be
evaluated in polynomial time

Characterising Classes

Suppose:

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z
- every function implemented by a functional program with properties X, Y, Z is in P

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a deterministic Turing Machine in polynomial time

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a deterministic Turing Machine in polynomial time
- \implies then F in P **if and only if** F can be implemented as a functional program with properties X, Y, Z

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a deterministic Turing Machine in polynomial time
- \implies then F in P **if and only if** F can be implemented as a functional program with properties X, Y, Z
- \implies “functional programs with properties X, Y, Z ” **characterise** P

Characterising Classes

Suppose:

- every function in P can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a deterministic Turing Machine in polynomial time
- \implies then F in P if and only if F can be implemented as a functional program with properties X, Y, Z
- \implies “functional programs with properties X, Y, Z ” characterise P

Characterising Classes

Suppose:

- every function in NP can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a non-deterministic Turing Machine in polynomial time
- \implies then F in NP if and only if F can be implemented as a functional program with properties X, Y, Z
- \implies “functional programs with properties X, Y, Z ” characterise NP

Characterising Classes

Suppose:

- every function in NP can be implemented by (e.g.) a functional program with properties X, Y, Z
- the outcome of every functional program with properties X, Y, Z can be evaluated by a non-deterministic Turing Machine in polynomial time
- \implies then F in NP if and only if F can be implemented as a functional program with properties X, Y, Z
- \implies “functional programs with properties X, Y, Z ” characterise NP

Result: question “P = NP?” reduced to: “does property Z limit expressivity (in context)?”

In 2001, Jones:

In 2001, Jones:

- defined a minimal functional programming language operating on lists

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k *characterise* EXPTIME^k

In 2001, Jones:

- defined a minimal functional programming language operating on lists
- introduced *cons-free* programs, which cannot generate new data
- showed that programs of data order k can simulate arbitrary deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- showed that arbitrary programs of data order k can be simulated by deterministic Turing Machines in $\mathcal{O}(\exp_2^k(n))$
- \implies proved that programs of data order k *characterise* EXPTIME^k
- (proved several other characterisations as well)

$$P = \text{EXPTIME}^0 \subset \text{EXPTIME}^1 \subset \text{EXPTIME}^2 \subseteq \dots$$

In 2001, Jones

- showed that cons-free programs with data order k characterise EXPTIME^k

In 2001, Jones

- showed that **deterministic** cons-free programs with data order k characterise EXPTIME^k

In 2001, Jones

- showed that deterministic cons-free programs with data order k characterise EXPTIME^k

In 2006, Bonfante

- showed that **non-deterministic** cons-free programs with data order 0 ...

In 2001, Jones

- showed that deterministic cons-free programs with data order k characterise EXPTIME^k

In 2006, Bonfante

- showed that **non-deterministic** cons-free programs with data order 0 characterise $\text{P} = \text{EXPTIME}^0$

In 2001, Jones

- showed that deterministic cons-free programs with data order k characterise EXPTIME^k

In 2006, Bonfante

- showed that **non-deterministic** cons-free programs with data order 0 characterise $\text{P} = \text{EXPTIME}^0$

In 2016, we

In 2001, Jones

- showed that deterministic cons-free programs with data order k characterise EXPTIME^k

In 2006, Bonfante

- showed that **non-deterministic** cons-free programs with data order 0 characterise $\text{P} = \text{EXPTIME}^0$

In 2016, we

- wondered whether non-deterministic cons-free programs with data order k characterise EXPTIME^k

In 2001, Jones

- showed that deterministic cons-free programs with data order k characterise EXPTIME^k

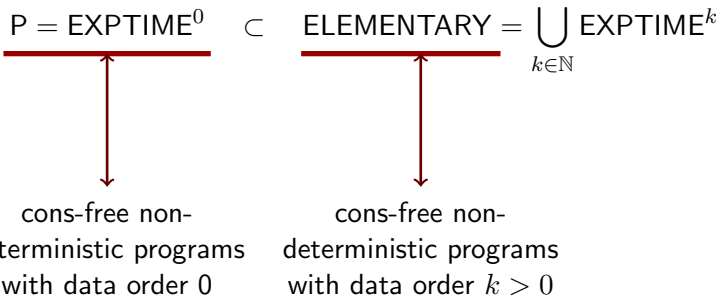

In 2006, Bonfante

- showed that **non-deterministic** cons-free programs with data order 0 characterise $\text{P} = \text{EXPTIME}^0$

In 2016, we

- wondered whether non-deterministic cons-free programs with data order k characterise EXPTIME^k
- found out that they don't

Overview

- 1 Motivation
- 2 Cons-free Programming / Term Rewriting**
- 3 Characterisations
- 4 Conclusion

Basics

Basics

- standard functional programming language:

Basics

- standard functional programming language: applicative term rewriting system with simple types and constructor rules

Basics

- standard functional programming language: applicative term rewriting system with simple types and constructor rules
- pair types are allowed

Basics

- standard functional programming language: applicative term rewriting system with simple types and constructor rules
- pair types are allowed
- constructors must be fully applied, and have a data type as output type

Basics

- standard functional programming language: applicative term rewriting system with simple types and constructor rules
- pair types are allowed
- constructors must be fully applied, and have a data type as output type
- call-by-value reduction

Basics

- standard functional programming language: applicative term rewriting system with simple types and constructor rules
- pair types are allowed
- constructors must be fully applied, and have a data type as output type
- call-by-value reduction
- **values** are:
 - ground terms built from constructors (**data**)
 - incomplete function applications $f v_1 \cdots v_n$ with all v_i values

Cons-free programs

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created
- in rules $\ell \rightarrow r$, the right-hand side r :

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created
- in rules $\ell \rightarrow r$, the right-hand side r :
 - *may* have subterms which are **data**

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created
- in rules $\ell \rightarrow r$, the right-hand side r :
 - *may* have subterms which are **data** (e.g. true, s 0, but not s alone)

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created
- in rules $\ell \rightarrow r$, the right-hand side r :
 - *may* have subterms which are **data** (e.g. true, s 0, but not s alone)
 - *may* have subterms occurring in ℓ

Cons-free programs

- in Jones: programs not containing the list constructor (“cons-free”)
- in practice: no new data is created
- in rules $\ell \rightarrow r$, the right-hand side r :
 - *may* have subterms which are **data** (e.g. true, s 0, but not s alone)
 - *may* have subterms occurring in ℓ
 - *may not* contain constructors otherwise

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\text{Hd } (h::t) \rightarrow h$$

$$\text{TI } (h::t) \rightarrow t$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

Evenlength $l \rightarrow$ Helper l True

Helper $[] b \rightarrow b$

Helper $(h::t)$ True \rightarrow Helper t False

Helper $(h::t)$ False \rightarrow Helper t True

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}\text{Half } 0 &\rightarrow 0 \\ \text{Half } (\text{S } 0) &\rightarrow 0 \\ \text{Half } (\text{S } (\text{S}(x))) &\rightarrow \text{S } (\text{Half } x)\end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}\text{Half } 0 &\rightarrow 0 \\ \text{Half } (S \ 0) &\rightarrow 0 \\ \text{Half } (S \ (S(x))) &\rightarrow S \ (\text{Half } x)\end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}
 \text{Half } x &\rightarrow \text{Helper } x \ x \\
 \text{Helper } 0 \ y &\rightarrow y \\
 \text{Helper } (\text{S } 0) (\text{S } y) &\rightarrow y \\
 \text{Helper } (\text{S } (\text{S } x)) (\text{S } y) &\rightarrow \text{Helper } x \ y
 \end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}\text{Last } (h :: []) &\rightarrow h \\ \text{Last } (h_1 :: h_2 :: tl) &\rightarrow \text{Last } (h_2 :: tl)\end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}\text{Last } (h :: []) &\rightarrow h \\ \text{Last } (h_1 :: h_2 :: tl) &\rightarrow \text{Last } (h_2 :: tl)\end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned}\text{fold } F \ z \ [] &\rightarrow z \\ \text{fold } F \ z \ (h::tl) &\rightarrow F \ h \ (\text{fold } F \ z \ tl)\end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned} \text{map } F \ [] &\rightarrow [] \\ \text{map } F \ (h::tl) &\rightarrow (F\ h)::(\text{map } F\ tl) \end{aligned}$$

Cons-free Higher-order Term Rewriting:

- right-hand sides:
 - *may* have subterms which are **data**
 - *may* have subterms which are also subterms of the left
 - *may not* contain constructors otherwise

$$\begin{aligned} \text{map } F \ [] &\rightarrow [] \\ \text{map } F \ (h::tl) &\rightarrow (F\ h)::(\text{map } F\ tl) \end{aligned}$$

Overview

- 1 Motivation
- 2 Cons-free Programming / Term Rewriting
- 3 Characterisations**
- 4 Conclusion

Recall:

$$\underline{P = \text{EXPTIME}^0} \subset \underline{\text{ELEMENTARY} = \bigcup_{k \in \mathbb{N}} \text{EXPTIME}^k}$$

cons-free non-
deterministic programs
with data order 0

cons-free non-
deterministic programs
with data order $k > 0$

We show:

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P
- a non-deterministic cons-free program with data order 0 can decide any decision problem in P

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P
- a non-deterministic cons-free program with data order 0 can decide any decision problem in P
- the decision problem accepted by a non-deterministic cons-free program is in ELEMENTARY regardless of data order

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P
- a non-deterministic cons-free program with data order 0 can decide any decision problem in P
- the decision problem accepted by a non-deterministic cons-free program is in ELEMENTARY regardless of data order
- a non-deterministic cons-free program with data order 1 can decide any decision problem in ELEMENTARY

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P
- a non-deterministic cons-free program with data order 0 can decide any decision problem in P
- the decision problem accepted by a non-deterministic cons-free program is in ELEMENTARY regardless of data order
- a non-deterministic cons-free program with data order 1 can decide any decision problem in ELEMENTARY

data order 0 \Rightarrow in P

Constructing an algorithm

data order 0 \Rightarrow in P

Constructing an algorithm

Rules:

$$\begin{array}{ll}

Observation:

Observation:

to simulate a machine running in $< f(n)$ steps,
we must only be able to represent numbers $0, \dots, f(n) - 1$

Observation:

to simulate a machine running in $< f(n)$ steps,
we must only be able to represent numbers $0, \dots, f(n) - 1$

Basic Idea:

- simulate numbers $< A \cdot (n + 1)^B$ by tuples $(l_1, \dots, l_B, l_{B+1})$

We show:

- the decision problem accepted by a non-deterministic cons-free program with data order 0 (so a first-order cons-free TRS) is in P
- a non-deterministic cons-free program with data order 0 can decide any decision problem in P
- the decision problem accepted by a non-deterministic cons-free program is in ELEMENTARY regardless of data order
- a non-deterministic cons-free program with data order 1 can decide any decision problem in ELEMENTARY

We show:

Basic Idea:

- simulate numbers $< A \cdot (n + 1)^B$ by tuples $(l_1, \dots, l_B, l_{B+1})$

Logical Conclusion:

if we can count up to $\exp_2^k(n)$ for any k

Observation:

to simulate a machine running in $< f(n)$ steps,
we must only be able to represent numbers $0, \dots, f(n) - 1$

Basic Idea:

- simulate numbers $< A \cdot (n + 1)^B$ by tuples $(l_1, \dots, l_B, l_{B+1})$

Logical Conclusion:

if we can count up to $\exp_2^k(n)$ for any k
then we can simulate any TM running in bounded time

Observation:

to simulate a machine running in $< f(n)$ steps,
we must only be able to represent numbers $0, \dots, f(n) - 1$

Basic Idea:

- simulate numbers $< A \cdot (n + 1)^B$ by tuples $(l_1, \dots, l_B, l_{B+1})$

Logical Conclusion:

if we can count up to $\exp_2^k(n)$ for any k
then we can simulate any TM running in bounded time
so we can handle all problems in ELEMENTARY
