

Term Rewriting

Philipp Dablander and Aart Middeldorp

Knuth–Bendix Completion Procedure (Simple Version)

input: ES \mathcal{E} and reduction order $>$
output: complete TRS \mathcal{R} such that $\leftrightarrow_{\mathcal{E}}^* = \leftrightarrow_{\mathcal{R}}^*$

$\mathcal{R} := \emptyset$ $C := \mathcal{E}$

while $C \neq \emptyset$ **do**

select $s \approx t \in C$

$C := C \setminus \{s \approx t\}$

compute \mathcal{R} -normal forms s' and t' of s and t

if $s' \neq t'$ **then**

if $s' > t'$ **then** $S := \{s' \rightarrow t'\}$

else if $t' > s'$ **then** $S := \{t' \rightarrow s'\}$

else failure

$C := C \cup \text{CP}(\mathcal{R}, S) \cup \text{CP}(S, \mathcal{R}) \cup \text{CP}(S)$

$C := \mathcal{R} \cup S$

Three Possibilities

Knuth–Bendix completion procedure may

- ① terminate without failure $\implies \mathcal{R}$ is complete and $\leftrightarrow_{\mathcal{E}}^* = \leftrightarrow_{\mathcal{R}}^*$
- ② terminate with failure
- ③ not terminate (divergence)

Definition

critical pair $t \approx u$ derived from critical peak $t \rho \leftarrow s \rightarrow_{\epsilon} u$ is **prime** if all proper subterms of $s|_{\rho}$ are in normal form

Theorem

terminating TRS is confluent \iff all prime critical pairs are joinable

Theorem

first-order theory of rewriting is decidable for left-linear right-ground TRSs

Outline

1. Summary of Lecture 7
2. Knuth-Bendix Order
3. Normalization Equivalence
4. Abstract Completion
5. Cola Gene Puzzle
6. Exercises
7. Further Reading

Definitions (Weight Function)

- ▶ **weight function** (w, w_0) consists of mapping $w: \mathcal{F} \rightarrow \mathbb{N}$ and constant $w_0 > 0$ such that $w(c) \geq w_0$ for all constants $c \in \mathcal{F}$
- ▶ **weight** of term t :

$$w(t) = \begin{cases} w_0 & \text{if } t \in \mathcal{V} \\ w(f) + \sum_{i=1}^n w(t_i) & \text{if } t = f(t_1, \dots, t_n) \end{cases}$$

- ▶ weight function (w, w_0) is **admissible** for precedence $>$ if

$$f > g \quad \text{for all } g \in \mathcal{F} \setminus \{f\}$$

whenever f is unary function symbol in \mathcal{F} with $w(f) = 0$

Example

- ▶ rewrite rules

$$\begin{array}{ll} e \cdot x \rightarrow x & x \cdot e \rightarrow x \\ x^- \cdot x \rightarrow e & x \cdot x^- \rightarrow e \\ (x \cdot y) \cdot z \rightarrow x \cdot (y \cdot z) & x^- \rightarrow x \\ e^- \rightarrow e & (x \cdot y)^- \rightarrow y^- \cdot x^- \\ x^- \cdot (x \cdot y) \rightarrow y & x \cdot (x^- \cdot y) \rightarrow y \end{array}$$

- ▶ weight function: $w(e) = w(\cdot) = w_0 = 1$ $w(^-) = 0$

$$w(e \cdot x) = 3 \qquad w(x) = 1 \qquad w((x \cdot y)^-) = 3$$

- ▶ precedence: $^- > \cdot > e$
- ▶ admissible because $^-$ is maximal in precedence

Definition (Knuth-Bendix Order)

binary relation $>_{\text{kbo}}$ on terms: $s >_{\text{kbo}} t$ if $|s|_x \geq |t|_x$ for all $x \in \mathcal{V}$ and either

- ▶ $w(s) > w(t)$
- ▶ $w(s) = w(t)$ and either
 - ① $s = f^n(t)$ for some $n > 0$ and $t \in \mathcal{V}$
 - ② $s = f(s_1, \dots, s_n)$ and $t = f(t_1, \dots, t_n)$ and for some $1 \leq i \leq n$
 - a $s_j = t_j$ for all $1 \leq j < i$
 - b $s_i >_{\text{kbo}} t_i$
 - ③ $s = f(s_1, \dots, s_n)$ and $t = g(t_1, \dots, t_m)$ and $f > g$

Theorem

$>_{\text{kbo}}$ is **reduction order** if $>$ is well-founded and (w, w_0) is admissible for $>$

Example 1

► rewrite rules

$$\begin{array}{ll}
 e \cdot x \rightarrow x & x \cdot e \rightarrow x \\
 x^- \cdot x \rightarrow e & x \cdot x^- \rightarrow e \\
 (x \cdot y) \cdot z \rightarrow x \cdot (y \cdot z) & x^{- -} \rightarrow x \\
 e^- \rightarrow e & (x \cdot y)^- \rightarrow y^- \cdot x^- \\
 x^- \cdot (x \cdot y) \rightarrow y & x \cdot (x^- \cdot y) \rightarrow y
 \end{array}$$

► weight function $w(e) = w(\cdot) = w_0 = 1$ $w(-) = 0$

► precedence $- > \cdot > e$

$$e \cdot x >_{\text{kbo}} x \quad x^{- -} >_{\text{kbo}} x \quad (x \cdot y)^- >_{\text{kbo}} y^- \cdot x^-$$

Example 2

► rewrite rules

$$aa \rightarrow bbb \quad bbbbb \rightarrow aaa$$

► weight function and precedence

$$\begin{array}{lll}
 w(a) = 3 & w(b) = 2 & a > b \\
 w(a) = 5 & w(b) = 3 & b > a \\
 w(a) = 13 & w(b) = 8 &
 \end{array}$$

Example 3

► rewrite rules

$$\begin{array}{llll}
 0 + 0 \rightarrow 0 & 1 + 0 \rightarrow 1 & \dots & 9 + 0 \rightarrow 9 & 0 : x \rightarrow x \\
 0 + 1 \rightarrow 1 & 1 + 1 \rightarrow 2 & \dots & 9 + 1 \rightarrow 1 : 0 & x + (y : z) \rightarrow y : (x + z) \\
 0 + 2 \rightarrow 2 & 1 + 2 \rightarrow 3 & \dots & 9 + 2 \rightarrow 1 : 1 & (x : y) + z \rightarrow x : (y + z) \\
 0 + 3 \rightarrow 3 & 1 + 3 \rightarrow 4 & \dots & 9 + 3 \rightarrow 1 : 2 & x : (y : z) \rightarrow (x + y) : z \\
 0 + 4 \rightarrow 4 & 1 + 4 \rightarrow 5 & \dots & 9 + 4 \rightarrow 1 : 3 & \\
 0 + 5 \rightarrow 5 & 1 + 5 \rightarrow 6 & \dots & 9 + 5 \rightarrow 1 : 4 & \\
 0 + 6 \rightarrow 6 & 1 + 6 \rightarrow 7 & \dots & 9 + 6 \rightarrow 1 : 5 & \\
 0 + 7 \rightarrow 7 & 1 + 7 \rightarrow 8 & \dots & 9 + 7 \rightarrow 1 : 6 & \\
 0 + 8 \rightarrow 8 & 1 + 8 \rightarrow 9 & \dots & 9 + 8 \rightarrow 1 : 7 & \\
 0 + 9 \rightarrow 9 & 1 + 9 \rightarrow 1 : 0 & \dots & 9 + 9 \rightarrow 1 : 8 &
 \end{array}$$

► weight function $w(0) = w(1) = w(2) = w(3) = w(4) = w(+) = w_0 = 1$ $w(:) = 2$

$$w(5) = w(6) = w(7) = w(8) = w(9) = 3$$

► precedence $+ > : \quad + > 5 \quad + > 6 \quad + > 7 \quad + > 8$

Example 4

► rewrite rules

$$\begin{array}{lll}
 11 \rightarrow 43 & 33 \rightarrow 56 & 55 \rightarrow 62 \\
 12 \rightarrow 21 & 34 \rightarrow 11 & 56 \rightarrow 12 \\
 22 \rightarrow 111 & 44 \rightarrow 3 & 66 \rightarrow 21
 \end{array}$$

► weight function and precedence

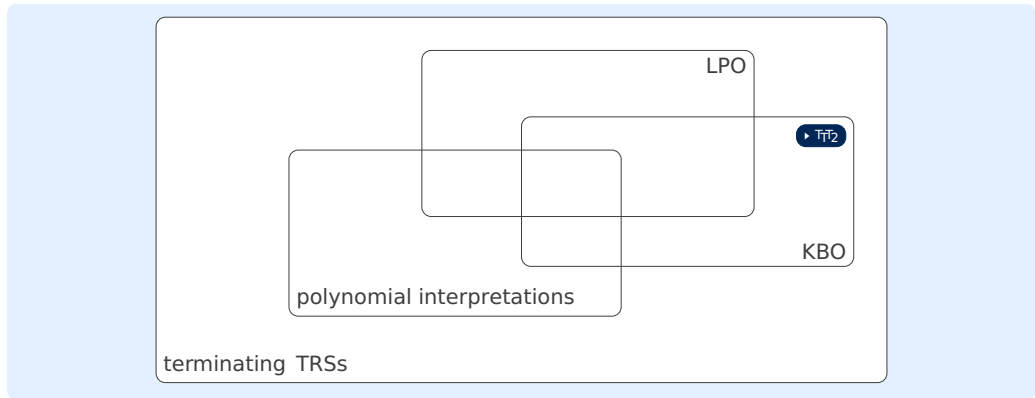

$$\begin{array}{lll}
 w(1) = 31 & w(2) = 47 & w(3) = 41 \\
 w(4) = 21 & w(5) = 43 & w(6) = 3 \\
 3 > 5 > 6 > 1 > 4 & 1 > 2 &
 \end{array}$$

Theorem

- ▶ if $> \subseteq \sqsupset$ then $>_{kbo} \subseteq \sqsupset_{kbo}$ (**incrementality**)
- ▶ if $>$ is total then $>_{kbo}$ is **total on ground terms**
- ▶ following two problems are **decidable**:
 - ① instance: finite TRS \mathcal{R} , weight function (w, w_0) , precedence $>$
question: $\mathcal{R} \subseteq >_{kbo}$?
 - ② instance: finite TRS \mathcal{R}
question: \exists weight function (w, w_0) such that (w, w_0) is admissible for $>$?
 \exists precedence $>$ and $\mathcal{R} \subseteq >_{kbo}$

Remark

KBO, LPO and polynomial interpretations are incomparable

Outline

1. Summary of Lecture 7
2. Knuth-Bendix Order
3. Normalization Equivalence
4. Abstract Completion
5. Cola Gene Puzzle
6. Exercises
7. Further Reading

Example

TRS $\mathcal{R} = \{1, 2, 3, 4, 5, 6\}$

TRS $\mathcal{S} = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$

$$\begin{array}{lll}
 x + 0 \xrightarrow{1} x & x + s(y) \xrightarrow{3} s(x + y) & p(s(x)) \xrightarrow{5} x \\
 x - 0 \xrightarrow{2} x & x - s(y) \xrightarrow{4} p(x - y) & s(p(x)) \xrightarrow{6} x \\
 s(x + p(y)) \xrightarrow{7} x + y & p(x - p(y)) \xrightarrow{8} x - y & \\
 x + p(y) \xrightarrow{9} p(x + y) & x - p(y) \xrightarrow{10} s(x - y) &
 \end{array}$$

rewrite rules 7 and 8 are redundant:

Observation

- ▶ fewer rewrite rules \implies fewer critical pairs
- ▶ TRS without redundancy = **reduced** TRS

Definition (Canonicity)

- ▶ TRS \mathcal{R} is **reduced** if for all $l \rightarrow r \in \mathcal{R}$
 - ① r is normal form of \mathcal{R}
 - ② l is normal form of $\mathcal{R} \setminus \{l \rightarrow r\}$
- ▶ reduced complete TRS is **canonical**

Example

TRS $\mathcal{R} = \{1, 2, 3, 4, 5, 6\}$

TRS $\mathcal{S} = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$

$$\begin{array}{lll}
 x + 0 \xrightarrow{1} x & x + s(y) \xrightarrow{3} s(x + y) & p(s(x)) \xrightarrow{5} x \\
 x - 0 \xrightarrow{2} x & x - s(y) \xrightarrow{4} p(x - y) & s(p(x)) \xrightarrow{6} x \\
 s(x + p(y)) \xrightarrow{7} x + y & p(x - p(y)) \xrightarrow{8} x - y & \\
 x + p(y) \xrightarrow{9} p(x + y) & x - p(y) \xrightarrow{10} s(x - y) &
 \end{array}$$

- ▶ \mathcal{R} is reduced
- ▶ \mathcal{S} is **not** reduced

Definitions (Equivalence)

- ▶ TRSs \mathcal{R} and \mathcal{S} are **conversion equivalent** if $\leftrightarrow_{\mathcal{R}}^* = \leftrightarrow_{\mathcal{S}}^*$
- ▶ TRSs \mathcal{R} and \mathcal{S} are **normalization equivalent** if $\rightarrow_{\mathcal{R}}^! = \rightarrow_{\mathcal{S}}^!$

Example

ARSS

$$\begin{array}{ll}
 \mathcal{A}_1: & a \longrightarrow b \\
 \mathcal{A}_2: & a \longrightarrow b \circlearrowright \\
 \mathcal{B}_1: & a \longleftarrow b \\
 \mathcal{B}_2: & \circlearrowleft a \quad b \circlearrowright
 \end{array}$$

- ▶ \mathcal{A}_1 and \mathcal{B}_1 are conversion equivalent but not normalization equivalent
- ▶ \mathcal{A}_2 and \mathcal{B}_2 are normalization equivalent but not conversion equivalent

Lemma

normalization equivalent **terminating** TRSs are conversion equivalent

Theorem

normalization equivalent **reduced** TRSs are **unique** up to literal similarity

Theorem

conversion equivalent **canonical** TRSs that are **compatible with same reduction order** are unique up to literal similarity

simplification **after** completion

Notation

$t \downarrow_{\mathcal{R}}$ denotes unique normal form t for complete TRS \mathcal{R}

Definition

- ▶ $\dot{\mathcal{R}} = \{\ell \rightarrow r \downarrow_{\mathcal{R}} \mid \ell \rightarrow r \in \mathcal{R}\}$
- ▶ $\ddot{\mathcal{R}} = \{\ell \rightarrow r \in \dot{\mathcal{R}} \mid \ell \in \text{NF}(\dot{\mathcal{R}} \setminus \{\ell \rightarrow r\})\}$

Theorem

if \mathcal{R} is complete TRS then $\ddot{\mathcal{R}}$ is (normalization) equivalent canonical TRS

more efficient: simplification **during** completion

Definition (Abstract Completion)

set of equations \mathcal{E} set of rewrite rules \mathcal{R} reduction order $>$

inference system **KB** consists of eight rules

<p>delete $\frac{\mathcal{E} \uplus \{s \approx s\}, \mathcal{R}}{\mathcal{E}, \mathcal{R}}$</p> <p>compose $\frac{\mathcal{E}, \mathcal{R} \uplus \{s \rightarrow t\}}{\mathcal{E}, \mathcal{R} \cup \{s \rightarrow u\}}$ if $t \rightarrow_{\mathcal{R}} u$</p> <p>orient $\frac{\mathcal{E} \uplus \{s \approx t\}, \mathcal{R}}{\mathcal{E}, \mathcal{R} \cup \{s \rightarrow t\}}$ if $s > t$</p> <p>$\frac{\mathcal{E} \uplus \{t \approx s\}, \mathcal{R}}{\mathcal{E}, \mathcal{R} \cup \{s \rightarrow t\}}$</p>	<p>deduce $\frac{\mathcal{E}, \mathcal{R}}{\mathcal{E} \cup \{s \approx t\}, \mathcal{R}}$ if $s \mathcal{R} \leftarrow \cdot \rightarrow_{\mathcal{R}} t$</p> <p>collapse $\frac{\mathcal{E}, \mathcal{R} \uplus \{t \rightarrow s\}}{\mathcal{E} \cup \{u \approx s\}, \mathcal{R}}$ if $t \rightarrow_{\mathcal{R}} u$</p> <p>simplify $\frac{\mathcal{E} \uplus \{s \approx t\}, \mathcal{R}}{\mathcal{E} \cup \{s \approx u\}, \mathcal{R}}$ if $t \rightarrow_{\mathcal{R}} u$</p> <p>$\frac{\mathcal{E} \uplus \{t \approx s\}, \mathcal{R}}{\mathcal{E} \cup \{u \approx s\}, \mathcal{R}}$</p>
--	---

Outline

1. Summary of Lecture 7
2. Knuth–Bendix Order
3. Normalization Equivalence
4. Abstract Completion
5. Cola Gene Puzzle
6. Exercises
7. Further Reading

Example

$$\begin{array}{ll}
 g(b) \approx g(b) & f(f(x)) \rightarrow g(x) \\
 f(b) \approx g(f(a)) & g(a) \rightarrow b \\
 & f(g(x)) \rightarrow g(f(x)) \\
 & f(b) \rightarrow g(f(a))
 \end{array}$$

- ▶ LPO with precedence $f > g > b > a$
- ▶ **canonical** TRS

Example

$$\begin{aligned} f(f(x)) &\approx g(x) \\ g(a) &\approx b \end{aligned}$$

$$\begin{aligned} g(x) &\rightarrow f(f(x)) \\ b &\rightarrow f(f(a)) \end{aligned}$$

► LPO with precedence $b > g > f > a$ **canonical** TRS

Example

$$\begin{aligned} f(f(a)) &\approx b \\ g(a) &\approx b \end{aligned}$$

$$\begin{aligned} g(x) &\rightarrow f(f(x)) \\ f(f(a)) &\rightarrow b \end{aligned}$$

► LPO with precedence $g > f > b > a$ **canonical** TRS

Lemma

if $(\mathcal{E}, \mathcal{R}) \vdash_{\text{KB}}^* (\mathcal{E}', \mathcal{R}')$ then

- 1 $\leftrightarrow_{\mathcal{E} \cup \mathcal{R}}^* = \leftrightarrow_{\mathcal{E}' \cup \mathcal{R}'}$
- 2 $\mathcal{R} \subseteq > \implies \mathcal{R}' \subseteq >$

Definition (Fair Run)

run for given ES \mathcal{E} is finite sequence

$$\mathcal{E}_0, \mathcal{R}_0 \vdash_{\text{KB}} \mathcal{E}_1, \mathcal{R}_1 \vdash_{\text{KB}} \cdots \vdash_{\text{KB}} \mathcal{E}_n, \mathcal{R}_n$$

such that $\mathcal{E}_0 = \mathcal{E}$ and $\mathcal{R}_0 = \emptyset$

► run **fails** if $\mathcal{E}_n \neq \emptyset$

► run is **fair** if $\text{PCP}(\mathcal{R}_n) \subseteq \downarrow_{\mathcal{R}_n} \cup \bigcup_{i=0}^n \leftrightarrow_{\mathcal{E}_i}$

Theorem

for every fair non-failing run

$$\mathcal{E}_0, \mathcal{R}_0 \vdash_{\text{KB}} \mathcal{E}_1, \mathcal{R}_1 \vdash_{\text{KB}} \cdots \vdash_{\text{KB}} \mathcal{E}_n, \mathcal{R}_n$$

\mathcal{R}_n is complete presentation of \mathcal{E}_0

Completion Tools

Waldmeister

mkbTT

KBCV

Maxcomp

Example

▶ ES \mathcal{E}

$$f(x) \approx f(a)$$

$$f(b) \approx b$$

▶ consider reduction order $>$

- ▶ if $f(b) \not> b$ then (\mathcal{E}, \emptyset) is normal form of \vdash_{KB}
- ▶ if $f(b) > b$ then

$$\begin{aligned} \mathcal{E}, \emptyset &\vdash_{\text{KB}} \{f(x) \approx f(a)\}, \{f(b) \rightarrow b\} \\ &\vdash_{\text{KB}} \{f(x) \approx f(a), b \approx b\}, \{f(b) \rightarrow b\} \\ &\vdash_{\text{KB}} \{f(x) \approx f(a)\}, \{f(b) \rightarrow b\} \\ &\vdash_{\text{KB}} \dots \end{aligned}$$

so completion fails

▶ TRS \mathcal{R} consisting of single rule $f(x) \rightarrow b$ is complete presentation of \mathcal{E}

Outline

2. Knuth-Bendix Order
3. Normalization Equivalence
4. Abstract Completion
5. Cola Gene Puzzle
6. Exercises
7. Further Reading

A team of genetic engineers decides to create cows that produce cola instead of milk. To that end they have to transform the DNA of the milk gene

TAGCTAGCTAGCT

in every fertilized egg into the cola gene

CTGACTGACT

Techniques exist to perform the following DNA substitutions

TCAT \leftrightarrow T GAG \leftrightarrow AG CTC \leftrightarrow TC AGTA \leftrightarrow A TAT \leftrightarrow CT

Recently it has been discovered that the mad cow disease is caused by a retrovirus with the following DNA sequence CTGCTACTGACT. What now, if accidentally cows with this virus are created? According to the engineers there is little risk because this never happened in their experiments, but various action groups demand absolute assurance.

Demo

KBCV developed by Thomas Sternagel

Example (Cola Gene Puzzle)

\mathcal{E} TCAT \approx T GAG \approx AG CTC \approx TC AGTA \approx A TAT \approx CT
 \mathcal{R} GA \rightarrow A AGT \rightarrow AT ATA \rightarrow A CT \rightarrow T TAT \rightarrow T TCA \rightarrow TA

- ▶ \mathcal{R} is canonical presentation of \mathcal{E}
- ▶ (milk gene) TAGCTAGCTAGCT $\leftrightarrow_{\mathcal{E}}^*$ CTGACTGACT (cola gene)

$$\text{TAGCTAGCTAGCT} \xrightarrow{\mathcal{R}} \text{T} \xleftarrow{\mathcal{R}} \text{CTGACTGACT}$$
- ▶ (milk gene) TAGCTAGCTAGCT $\not\leftrightarrow_{\mathcal{E}}^*$ CTGCTACTGACT (mad cow retrovirus)

$$\text{TAGCTAGCTAGCT} \xrightarrow{\mathcal{R}} \text{T} \neq \text{TGT} \xleftarrow{\mathcal{R}} \text{CTGCTACTGACT}$$
